101
862 915 960 1016
1283
and treatment of
(H Hamilton) 458
—— defence and Col E F Harris on 980
—— poisoning Sequelæ of 907—Protection against 915
Gas respirator supply of 157
Hospital accommodation for casualties 719
—— services in air raid 1505
Hospitals London and air raid 1307
—— mental and 154
Medical service in air raid 1
Lambeth and division on 150
Questions in Parliament 760 1000 1158
Services of Dr J H Hebb 161
Underground car parks for London 1018
See also War—National Defence
Aitken Robert Steven on appointed Regius Professor of Medicine in University of Aberdeen 913
ALBRICO B Two cases of air transfusion 830
Albuminuria final case of term 604
Alcohol injection in inoperable malignant growth of jaw and tongue (Wilfred Harris) 971 (O)
—— and mental disorder 847
ALEXANDER Electrical Injuries 710
—— J B Medical evidence at inquest 1305
Alvarez G N obituary notice of 41
Alver Ellice M awarded Leslie Dana Gold Medal 1347
Aluminium carbohydrates and 150
ALLAN F C Lichen lenthemin 1051
ALLEN Clifford Psychotherapy in organic disease 370
—— F Thumbprint for nurse on 1209
—— Frank Worthington (and Carl L SCHMIDT) *Fundamentals of Electrocardiography and Experimental Research* rev 959
Allergy and immunity in ocular tuberculosis 625 760
—— tannic in and allergic diathesis (A M Kennedy and D A Williams) 1701 (O)
ALLPORT Gordon W *Personality: A Psychological Interpretation* rev 1205
Alopecia treatment of 501
Ambulance in trunk roads Improvement of 905
AMEUILLE F Suicide by tubercle bacilli 455
Amoebic carbarsone in 905
Anaemia aplastic with complete recovery (T H Boon) 1041 (O)—Correspondence on 1205
—— and gastro-intestinal tract (Jan T M Vaughan) 507 (O)—Correspondence on 559
—— nutritional macrocytic in Macedonians 914
—— pernicious anti pernicious principle some experiment with urine (Edouard Jequier and C P M Apsey) 904 (O)—Correspondence on 1117 1205
—— —— and psychoses 1167
—— tropical macrocytic 1052
Anaemia haemolytic of childhood (J G Parsons) 501
Anaesthesia basal 244
—— carbohydrate metabolism in (F P Macintosh and C L G Pratt) 310 603 (O)
—— helium in (W Stanley Sykes and Reginald C Lawrence) 445 (O)
—— review of books on 1251
—— spinal 544
—— spinal blood pressure after 44
Anaesthetic aspects of history of (A J Clark) 544 1029 (O)
—— basal hypersensitivity to (B P Hill) 1109 (O)
—— diplomas in 950
—— electrical ignition of (H W Swann) 504
Analgesia review of book on 407
Anal pruritus pharmacological actions of 951
Anaesthesia gas and air Apparatus for 976—In midwifery 1402
—— review of books on 1201
Anaesthesias admission to by midwives 157
Anatomy acad mic versus clinical 764
—— review of books on 1206 1207 1401 1505
—— terminology 903
ANDERSON C G *Introduction to Electrocardiography and Clinical Chemistry* rev 1209
—— D H Dietary fat absorption in childhood 932
ANDERSON D M (and J H DIXON) Acute bulbar paralysis 1077 (O)—Correspondence on 1251
—— E W Further observations on benadryl 1040 (O)
—— J Lorrett Green tools a 743
—— R Mammary cancer and menopause 1275
—— T (W P SYNDERAS and J L PEVSNER) sulphanilamido-chrysoidine sulphanilamide and benzylsulphanilamide in streptococcal infections 849 (O)
—— W A H Kidney and agriculture 1330
ANDREW C H Immunity in influenza 1113
Andrew E Collinwood obituary notice of 981
—— M C A pirin poisoning 1019
Aneurysm of common iliac carotid (J Nuttall Haworth) 660
Angina of effort cure of by hot air douche 1115
—— pectoris (P Hallerdal Dixon) 891—Correspondence on 1251
—— pectoris rotation of adrenalin in 415
Angiography paper and discussion on 1141
Anhidrotic streaks-elephantoid dystrophica 999
Anthropometric anthropography importance of 880
Animal Health Problems review of 633
Animals experimentation on in 1905 459
—— wild a carrier of resevoir of disease 807
Ankle traction exhibition at (W B P Monteith) 1030
Annales de Médecine Omnibus rationnelle et de spécialités 974
—— de Médecine et de Chirurgie articles by Nanta et Vogt in 1
—— de la Société Belge de Chirurgie et Journal de Chirurgie table of volume 644

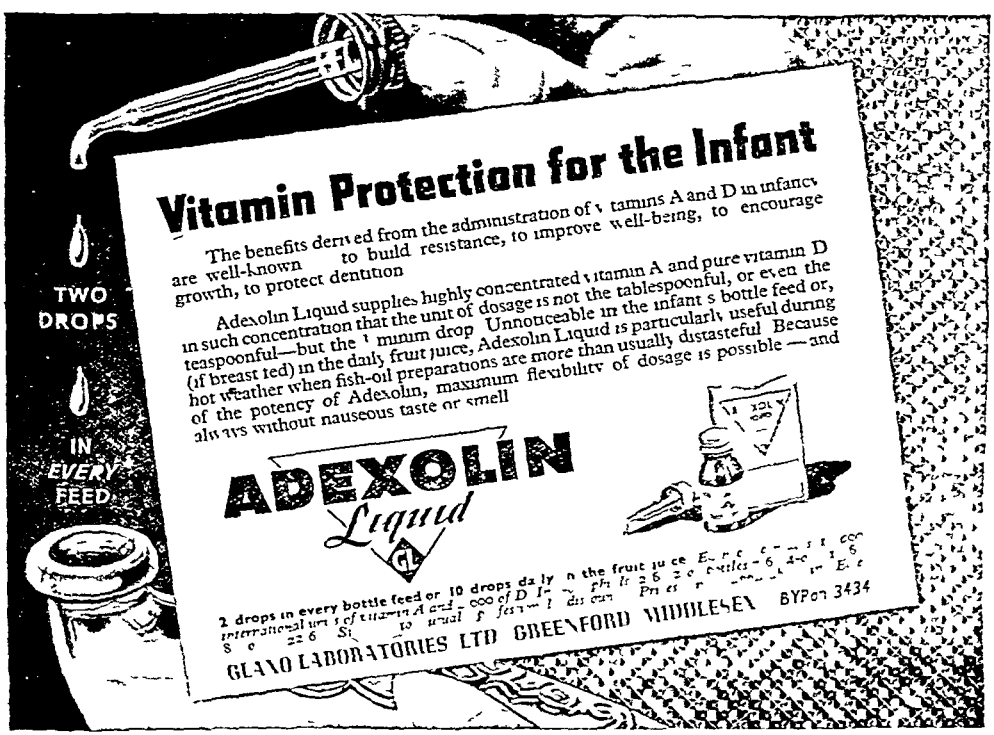
JOHN WYETH & BROTHER LTD., 25, OLDHILL PLACE, LONDON, N 16

Benger's Food is specially devised to be used with fresh cow's milk

Benger's Food when prepared is a dainty food cream in which the tough curd of cow's milk has been broken down so that it can no longer form indigestible clots. Because it is so easy of assimilation Benger's Food is almost universally prescribed by the Medical Profession for enfeebled digestion and for extreme conditions its prescription is almost standard. Benger's Food is so delicious that it is eaten with enjoyment by those who find milk or diluted milk unpalatable.



A physician's sample and pamphlet post free on request.

"ALOCOL"

Colloidal Hydroxide of Aluminium

For Gastric or Duodenal Ulcer

IN view of the increasing adoption of intensive alkaline medication for gastric and duodenal ulceration, the selection of a suitable antacid agent is a matter of considerable importance to the general practitioner

Alocol allows of antacid therapy in a particularly effective, safe and reliable form, and replaces with advantage mixtures composed of sodium bicarbonate, magnesia, bismuth, etc It does not determine any unpleasant secondary reactions, even when taken in strong doses and over a long period of time

The powerful antacid effect of "Alocol" is more mechanical than chemical in nature It acts by adsorbing excess of hydrochloric acid, thus facilitating its elimination It promptly relieves pain and being non absorbable is free from toxic sequelae

Complete chemical history of Alocol with convincing clinical reports and supply for trial sent free to physicians on request

A WANDER, Ltd, Manufacturing Chemists,
184, Queen's Gate, London, S W 7

Works KING S LANGLEY HERTFORDSHIRE M787

ALASIL

Better Salicylate Therapy

WHATEVER be the season of the year there is a wide sphere of utility for Alasil, the improved form of salicylate medication

Alasil is a very definite advance on ordinary compounds of salicylic or acetyl salicylic acid both in therapeutic efficiency and in freedom from the risk of unpleasant gastro intestinal sequelae This high tolerability is due to the fact that Alasil is composed of calcium acetyl salicylate—the least irritating of the salicylate compounds—and Alocol (Colloidal Hydroxide of Aluminium) a powerful gastric sedative and antacid

A careful series of experimental tests has shown that Alasil is more completely absorbed than ordinary salicylate compounds and that it is practically free from the risk of liberating free salicylic acid in the stomach

Wide clinical experience anticipated these findings by demonstrating that Alasil can be pushed or prolonged to a much greater extent than ordinary salicylate compounds and that it can be given with safety to children adults the aged and patients with finely balanced digestive capacities An analgesic antipyretic and sedative of established value

A supply for clinical trial with full descriptive literature sent free on request

AT THE EXHIBITION OF

THE BRITISH MEDICAL ASSOCIATION

TAMPAX

THE *Adaptation of the medical tampon to menstrual hygiene*

Members of the medical profession will at once appreciate the significance of the new method of sanitary protection which is being displayed at the Exhibition of the British Medical Association

The principle of Tampax is that of the vaginal tampon, which every doctor knows to be safe and efficacious for absorbing cervical discharges at the site Dispensing with sanitary towels Tampax spares the patient much local discomfort and minimises risk of infection

Tampax is made of long fibred surgical cotton wool which has been sterilised and highly compressed Each tampon has an absorption capacity of 1—1½ ounces It is individually sealed within its own patented applicator which enables every user to insert it in the proper position without contact with the hand The tampon is easily removed by means of a cord sewn through the cotton by an exclusive stitching process which makes disintegration impossible The tampon being contained within the vagina away from contact with the urethra contamination from this source is minimised There is complete elimination of labial irritation Odour is almost entirely prevented as the menstrual fluid does not come into contact with the air

Tampax may confidently be recommended by physicians to their women patients the only exceptions being those infrequent cases of intact hymen with orifice too small for insertion

TAMPAX is displayed at Stand No 43 of the Exhibition of the B M A, where a qualified attendant will explain the method of construction of the tampon and the principle of the applicator Samples and all further information may be obtained at the Stand, or on request to Tampax Ltd, 10, Bolton Street, London, W 1

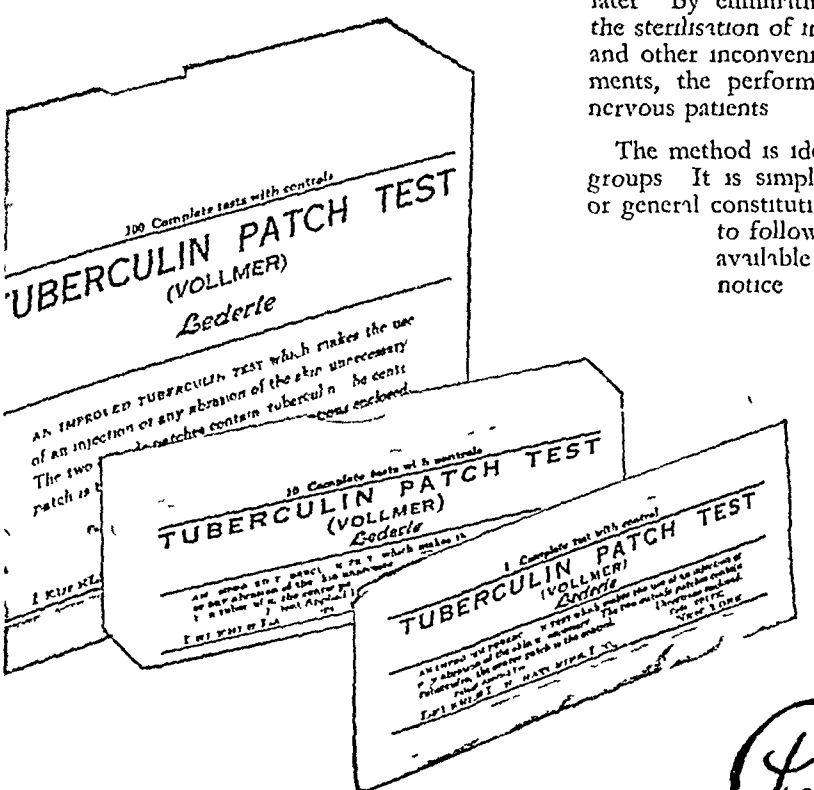
A new test for Tuberculosis

TUBERCULIN PATCH TEST

(VOLLMER)



Lederle

THE notable progress made in recent years in the control of tuberculosis has been due in large measure to earlier diagnosis and improved methods of diagnosis

Among the significant advances in tuberculin testing is Vollmer's development of the *tuberculin patch test* This test, which has been shown by clinical trial to be at least as reliable as the Pirquet test, possesses the important advantage of insuring co-operation of the patients, especially in the cases of children

The patch is applied for 48 hours and read 24 hours later By eliminating pain, elaborate preparation in the sterilisation of instruments, etc trauma to the skin and other inconveniences attending the use of instruments, the performance of the test avoids exciting nervous patients

The method is ideally suited to the testing of large groups It is simple, safe and time-saving A focal or general constitutional reaction has not been known to follow the application of the test It is available for immediate use at a moment's notice

"TUBERCULIN PATCH TEST (VOLLMER) *Lederle*" is available in the following packages—

Single tests	1/3
10 tests	10/3
100 tests	42/-

A major operation in progress in the operating theatre of a London Hospital

THE DANGER OF INFECTION

It is not only in the operating theatre that the value of antiseptic protection is to-day recognised Men and women in everyday life are learning the importance of germ-free cleanliness More careful attention to hygiene is resulting in better standards of health

Of course, it is not possible in everyday hygiene for ordinary people to take such elaborate precautions against infection as those taken by the surgeon before an operation Nevertheless, protective measures against the daily risks of infection are obviously needed, and it is generally accepted that the simplest and probably the most effective protection is that given by washing exposed parts of the body, such as the hands and face regularly with a reliable antiseptic soap

Wright's Coal Tar Soap has enjoyed the confidence of the medical profession for health protection for over 70 years It has substantial antiseptic and antipruritic qualities, and is made from the costliest materials obtainable It is the only soap in the world to contain 'liquor carbonis detergens' (Wright's), the valuable skin therapeutic recommended by leading dermatologists An investigation by the Institute of Industrial Psychology reveals that more doctors *themselves* use Wright's than any other brand of *toilet soap* *You are safe in recommending* Wright's to your patients—and in using it in your own practice

WRIGHT'S COAL TAR SOAP

The Safe Soap

Wright Layman & Umney Ltd 44 to 50 Southwark Street S.E.1

For the
EARLY PREVENTION
of
VITAMIN & MINERAL DEFICIENCY
IN INFANTS

It is now a widely recognized fact that infants need vegetable food as early as possible in order to balance and augment the usual milk diet The difficulty, hitherto inseparable from vegetable in any form, has been the intestinal disturbance—notably diarrhœa—of which inability to digest the tough fibrous tissue surrounding the food cells is the primary cause

By the Libby process of Homogenization this fibrous covering is broken up into fine particles which provide non-irritant bulk and smooth, easy elimination The nutriment is of course at the same time released so that it comes into direct contact with the digestive enzymes

There are six scientifically formulated combinations of Cereals Vegetables and Fruit in Libby s Homogenized Foods which can be prescribed in any case where Vitamin and mineral deficiency is indicated and have been given successfully to infants as young as 12 to 8 weeks

A partial analysis of one combination set out in the table below, shows how the deficiencies in any one vegetable are compensated for by the values in the others

Partial Analysis of a Group of Vegetables

THE MEDICAL CASE FOR A WHOLE WHEAT CRISPBREAD

*

WHEAT has always been Man's first choice among the cereals, whenever climatic conditions did not prevent his getting it. That remains true of all bread, either white or wholemeal, either soft or biscuit-crisp. And Vita-Weat, the wheaten crispbread with the WHOLE of the wheat left in it, has advantages which entitle it to a very high place among the staple foods of the world.

ITS CALORIFIC VALUE

Bread is *the* 'energy component' and Vita-Weat, since it contains only 3 per cent. of water, has a fuel value nearly twice that of ordinary bread—according to *The Practitioner* its calorie value is 2,132 per lb.

Each section of such a crisp bread—each 'slice,' so to speak—has a calorie value of 37. That is to say that in meeting what is probably the greatest requirement of a national staple food Vita-Weat is *almost twice as effective as the softer kinds of wheaten bread.*

STARCH AND DIGESTION

A crisp bread, obviously, calls for a more thorough chewing than a soft 'crumb' bread and salivation is therefore more healthily promoted. The starches and cellulose in Vita-Weat are also 'converted' into a more digestible form by the special processes which go to make a good crispbread—just as toast and crust have become greatly more digestible than bread in its quite unconverted' starchy form. While *all* the wheat berry is used the bran and fibre are thoroughly di-integrated.

The result is, therefore, that the weight which quantities of unconverted starch places on the digestion is almost entirely eliminated where Vita-Weat has been prescribed.

VITA-WEAT AND ITS ADVANTAGES

In addition to these great advantages of superior fuel-value and digestibility Vita-Weat retains the 'protective' elements of the wheat-berry which are frequently rejected in the 'refining' of white flours. Proteins, vitamins and minerals in which bread is normally deficient are present and the 'balance' of this crispbread as a food is therefore increased.

The use of Vita-Weat can be shown to be especially desirable in cases of mild anæmia, liability to infection, lack of appetite, poor digestion, diabetes, obesity and as a food of 'protective' value to the teeth.

A little booklet has been prepared for the medical profession briefly summarising the medical case for a whole wheat crispbread and it will gladly be sent post-free to any doctor on application to Peek Frean & Co., Ltd., Keetons Road, London, S.E. 16.

Vita-Weat

THE BRITISH WHOLE WHEAT CRISPBREAD

Antiphlogistine BRAND DRESSING IS useful as a surgical dressing

It is antiseptic in the bacteriostatic sense, without harsh or caustic qualities It has a tonic action on the capillaries Its use obviates the need for constant redressing of a wound Its application and removal are not painful It is an aid to leucocytosis and, therefore, *a real adjunant to the natural healing process*

INDICATIONS FOR 'SANATOGEN' No 4

General Debility

"91% subnormal"

found the Pioneer Health Centre at Peckham.

The physicians responsible for the celebrated Pioneer Health Centre at Peckham recently examined 1530 individuals, composing 500 families Of these, 8 per cent were under medical treatment for recognised disease, but of the remainder only 9 per cent were perfectly healthy, whilst 1270 persons were found to "have something the matter, and to be doing nothing about it"—most of them believing themselves to be well This widespread subnormality would seem to be attributable to urbanisation and industrialism on the one hand, and to faulty nutrition on the other Experience has shown that the body's disease-resisting capacity is greatly increased by the regular use of 'Sanatogen'—a carbohydrate-free product of 95 per cent pure milk casein, with 5 per cent sodium glycerophosphate 'Sanatogen' is easily digested and quickly absorbed It strikingly promotes healthy nervous functioning and the harmonious interplay of the endocrine glands

'SANATOGEN'

Casein and Sodium Glycerophosphate

Testimony by members of the Medical Profession . . .

Read what a doctor says —

"I may say that I frequently recommend 'Typhoo' tea to patients who cannot take the common varieties without the production of dyspepsia" M R C S, L R C P

The above is one of many hundreds of testimonials received

Medical men and women, throughout the country, are recommending our pure "Typhoo" tea as indicated by the daily despatch of hundreds of samples which doctors direct us to send to their patients.

Delicious

"Ty-phoo" TEA

is so mild that it does not cause indigestion

Further

you save by using "Typhoo for being so rich in 'leaf-edge" it "goes just half as far again' as coarse astringent tea

Over 18 000 DOCTORS use "TY PHOO" in their own homes

Write to

Sumner's Ty-phoo Tea Ltd., Birmingham, 5, for a FREE sample

(This offer applies only to the British Isles We regret that we cannot send 'Typhoo tea abroad)

"Vitamin B_1 deficiency an outstanding fault

in the diet of many millions of people"

(*B M J*, 16 *Oct*, 1937, *p* 753)

The reduction in Vitamin B_1 intake, due to changes in dietary habits during the last hundred years, normally amounts to at least 50 per cent, and may be as much as 70 per cent It has been demonstrated, both experimentally and clinically, that a shortage of Vitamin B acts as a limiting factor in the maintenance of health and nutrition, and often results in gastro intestinal disorders, loss of appetite, indigestion, constipation and, if long continued, to neuritis and arthritis

The logical way to rectify such shortage is to restore to the diet the Vitamin B-containing substance whose removal is responsible for the deficiency

This substance is available in the form of Bemax

For years it has been the policy of the proprietors of Bemax to ensure its Vitamin B_1 activity by biological assay of *every day's output* So far as is known, Bemax is the only food product for which such a claim is or can be made

The quantity of Vitamin B_1 supplied by the normal daily dose of Bemax—one tablespoonful—is 200 International Units, an amount sufficient to raise a deficient diet to an optimal level

The normal daily dose of Bemax supplies, in addition to Vitamin B_1, significant quantities of Vitamin B and B_2, Copper, Iron and Phosphorus as well as rich quantities of Vitamin E and other essential dietary elements

Bemax is an entirely natural product consisting only of stabilised wheat germs selected for their Vitamin B_1 activity with no addition whatsoever Clinical sample and literature on request The Bemax Laboratories, 23, Upper Mall, Hammersmith, W 6

Sterility and Habitual Abortion

The increasing use of Vitamin E for habitual abortion and sterility of dietary origin demands a wheat germ oil of proven high activity and of stable Vitamin value Such an oil is available for the medical profession in Fertilol

A SURVEY OF PROSTATIC ENLARGEMENT AND ITS TREATMENT*

BY

KENNETH WALKER, F R C S

Genito Urinary Surgeon Royal Northern and St Paul's Hospitals London

The fact that I propose to give a general survey of prostatic enlargement and note any advances that have been made in our understanding of it and in our methods of treating it, is an indication that I have reached that time of life at which a man is prone to look back into the past and to contrast what he thought once with what he thinks now And in spite of the big gaps that still remain in our knowledge and of the imperfections of our treatment this survey will give cause for satisfaction The last ten years have witnessed a great activity not only in our surgery but also in our knowledge of the aetiology of prostatic enlargement We have made definite progress and unless I am mistaken are on the threshold of still greater advances

Some sixteen years ago I had the honour of delivering a Hunterian lecture before the Royal College of Surgeons on The Nature and Causes of Old Age Enlargement of the Prostate When I came to assess the result of my two years work on this subject it amounted to little more than an assertion that every theory that had so far been advanced to explain the nature and causes of prostatic enlargement was inadequate We were not only in ignorance of its aetiology we did not even know what it was The only positive statement in my lecture was the following which I give verbatim

> The close dependence of the prostate on the ductless glands during its period of development affords sufficient ground for considering carefully the possibility that enlargement may be associated with some change in the endocrine system The menopause in the female is generally accompanied by a temporary loss of endocrine balance and it is not improbable that a similar state of affairs may arise during the period of sexual decline in the male The condition of the endocrine glands in cases of prostatic enlargement offers a fruitful field for research

This at the time was a new point of view Up till then enlargement of the prostate had been considered to be an inflammatory lesion (Czechanowsky and Rothschild 1903) an adenoma (Cohnheim Rindfleisch and Velpeau) or a form of degeneration associated with arteriosclerosis (Launois 1882) My suggestion that it might be the result of a disturbance of the endocrine balance was a blind shot that modern research has shown to have been very near the mark I did not know at the time that Paul (1910) of Liverpool had twelve years previously been struck by the resemblance between the enlarged prostate and involutionary cystic mastitis and had suggested that enlargement was an involutionary lesion similar to that of the female breast at the time of the menopause

It is difficult to say what particular subsequent research was responsible for establishing beyond doubt the endocrine factor in enlargement but if emphasis is to be placed on the work of any one researcher it would have to be on that of Lacassagne in 1933 While experimenting on the carcinogenetic powers of various sterols Lacassagne found that if oestrone was administered over long periods to mice it produced an overgrowth of the dorsal prostatic lobes This interesting discovery was confirmed independently by de Jongh (1933) by Burrows and Kennaway (1934) and by other workers

Care must be exercised in applying these results to the problems of human enlargement The dorsal prostatic lobe of a mouse is a specialized gland secreting a semen coagulant There is no true homologue of this in man Zuckerman and Groome (1937) have however shown that prostatic enlargement can be produced in dogs by injections of oestrone and that the histology of this artificially produced enlargement is similar to that which often occurs spontaneously in this animal Parkes and Zuckerman (1935) have also studied the histology of the oestrone stimulated prostates of monkeys and found that they undergo a fibro muscular overgrowth and a stratification of the uterus masculinus

These experiments suggest that enlargement of the prostate in man may also be due to the action of an excess of oestrogenic substance It has of course long been known that the male body forms oestrogenic as well as male hormones and that both of these substances could be extracted from the testis It is therefore not illogical to suppose that an upset in the normal balance between these two antagonistic principles may be the cause of prostatic enlargement But so far no direct confirmation of this theory has been obtained from any quantitative estimate of the hormones formed by sufferers from prostatic enlargement Hamilton and his co-workers (1936) failed to extract any oestrogenic substance from seven enlarged prostates and Lower (1933) stated that the concentration of male hormone in the blood of prostatics was even higher than normal Buehler (1933) has however

* A paper read to the Gloucestershire Branch of the British Medical Association

asserted that this is only true of the blood of the younger prostatics, and does not apply to older patients Direct evidence is therefore still lacking that artificially produced prostatic enlargement in animals is a true analogue of the condition found in man, and we shall have to wait for further evidence before we can feel fully satisfied that we have really found the key to the riddle Our uncertainty need not, however, prevent us from attempting in the light of these animal experiments, treatment along hormonic lines This subject will now be considered

Hormonic Treatment of the Enlarged Prostate

The fact that the testicle forms both male and female hormones supplies a rationale for the old treatment of prostatic enlargement by means of castration No modern surgeon would care to revive this practice, even although in many cases it appears to have achieved its object—namely, the shrinkage of the prostate He prefers rather to aim at restoring the normal balance between the two principles by injecting male hormone De Jongh has shown experimentally that male hormone does possess the power to inhibit the action of oestrone on the prostate, and Parkes and Zuckerman (1935) have confirmed his findings in the case of monkeys Incidentally it would appear that progestin is capable of exerting the same antagonistic action as male hormone, thus supplying another example of interchangeability of hormone in the two sexes

There is plenty of experimental support, therefore for the attempt to deal with human enlargement by means of endocrine therapy either directly by injection of male hormone or else indirectly by the use of gonadotropic substances Until recently these attempts have been handicapped by the difficulty of injecting enough hormone to produce an effect, but with improvements in methods of extraction and of manufacture this difficulty is being overcome The Ciba Company have now prepared ampoules containing 50 mg of testosterone propionate in sterile oil A large supply of this has been put at the disposal of the Medical Research Council, and some half-dozen of us are testing it out on carefully investigated cases of prostatic enlargement What will be the outcome of this trial remains to be seen It must be remembered that second only in importance to the actual hormone preparation given is the method of giving it

Important work, which may have a bearing on future lines of treatment, is at present being done by Parkes Zondek and others on the rate of absorption of hormone after injection The ideal to be aimed at is to ensure a slow continuous absorption of small amounts over a long period A result that has been obtained in animals by injecting compressed tablets of hormone into the muscle It is possible therefore that new methods of administration will in the future play a part in the hormonic treatment of prostatic enlargement

The Steinach Operation

Bilateral vasectomy was used as long ago as 1890 by Lichtenstern of Upsala in the treatment of prostatic enlargement as a substitute for castration Interest in this operation was revived by the writings of Steinach in 1918 and it has since been used extensively as a treatment of both premature senility and prostatic enlargement on the assumption that it increased the output of male hormone in the testicle The original Steinach operation of ligature of the vas not having given satisfactory results Niehans in 1927 substituted for it ligature of the efferent ducts of the testicle It is difficult to see why a ligature in this situation should prove more effective than a ligature placed higher up on the vas It is even uncertain that a cutting off of the external secretion of the testicle is necessarily followed by an increased output of hormone Nevertheless Niehans and other operators have claimed many successes for this simple form of treatment

The proof of the pudding lies in the eating, the value of Niehans's operation can only be assessed by the results that are obtained from it The ingenious endocrinological arguments put forward by Niehans as a justification of his operation carry with them little conviction, for in the present state of endocrinology it is possible to bolster up almost any thesis by choosing those observations that happen to support it and rejecting those that are opposed to it We would be wise, therefore, to judge the Niehans operation by the results that follow it rather than by the endocrinological arguments that support it What, then, are the clinical results of the ligature operation that goes under the name of Steinach II? Niehans himself gives no actual statistics, but makes only the following general statement

> Since 1927 I have operated on about six hundred prostatic patients in my clinic at Clarens and in the hospitals at Vevey and Montreux, and my experience for ten years empowers me to assert that Steinach's ligature II is particularly suitable for the soft adenoma of the prostate so often encountered and equally suitable for myomata whilst its influence is less apparent or *nil* on small hard fibromata In fact, the great majority of hundreds of patients with adenoma of the prostate who have undergone Steinach ligature II see their bladder troubles gradually disappear often indeed very quickly They pass urine more easily and in greater quantities, consequently less often Strangury ceases and the bladder is completely emptied The prostate decreases in size'

Niehans's statements have found little favour either in Europe or in America, and few urologists of repute have even given his methods a trial Personally I feel that, however incredulous one may be about any form of treatment, it should not be condemned offhand without any attempt having been made to assess its value I have therefore during the last two years carried out Niehans's ligature operation on a number of patients who have come to me with the express wish that I should do so Out of some thirty patients within my range of observation, three only would appear to have benefited from their operation and to have maintained their improvement Three or four others have asserted that they were slightly better and the remainder have either expressed doubt whether any change had occurred or else have been sure that it had not

The only statistics bearing on the subject of the Steinach II operation that I can find are those published by Elliot-Smith (1936) He performed the operation on twenty patients, most of whom were admitted to hospital as emergency cases with acute retention Three died and seventeen left hospital with four ounces or less of residual urine It was noticeable that several patients with complete retention passed urine on the same day as the operation This makes it likely that the improvement was due to a reflex action on the sphincter mechanism at the neck of the bladder It is inconceivable that in so short a time any change could have been effected through the influence of hormones

The Surgery of Prostatic Obstruction

It is unnecessary in this paper to describe at length the work of Bellfield and Fuller in America and of McGowan and Freyer in this country in laying the foundations of

prostatic surgery Here we are not concerned with foundations but with the building that is being erected on those foundations What form is it now taking? Where have we failed in our building and where have we succeeded?

In the *British Medical Journal* of July 20 1901 Freyer first advocated and described the technique of suprapubic enucleation of the prostate It was a crude and blind proceeding guided only by the sense of touch and entailing the insertion of a finger in the rectum After enucleation no attempt was made to deal with haemorrhage by the usual method of ligature or suture reliance being placed on the haemostatic processes of the body to bring bleeding to an end Drainage was provided for by means of a large tube inserted not in the most dependent but in the highest part of the field of operation Although the results were as a rule excellent no conscientious surgeon could feel entirely satisfied with the operation described by Freyer since it violated almost every surgical principle Obviously it could only be regarded as a stepping-stone to a more finished operation

We will now consider the efforts that have been made to get rid of the shortcomings of the Freyer technique and try to estimate what success if any has attended them

The Perineal Operation

In this country these efforts have been mainly directed to a more finished toilet of the prostatic bed and to the adoption of better methods of arresting post operative haemorrhage We have hitherto never departed very far from the original technique nor abandoned for long the suprapubic approach to the prostate In America the suprapubic route has been seriously challenged by the perineal operation elaborated by Proust, and strongly advocated by H H Young of Baltimore There are many points in its favour, notably the better drainage provided by a wound in the perineum and for a time the protagonists of the suprapubic and of the perineal routes seemed evenly matched Of late years however, the protagonists of the suprapubic operation have steadily gained ground and it is now chiefly through the influence of H H Young and of those trained in his clinic that perineal prostatectomy still remains the routine operation for the relief of prostatic obstruction in certain American clinics In this country it has never gained any hold A few of us have at one time or another been attracted by the advantages of the perineal operation and have provided ourselves with the necessary equipment for carrying it out but at the end of a year or two this equipment has usually found its way into our surgical lumber rooms

Suprapubic Prostatectomy

The first serious effort to eliminate the more obvious shortcomings of the Freyer operation was made by the late Sir J Thomson Walker in 1928 By means of a larger suprapubic incision, introducing a suitable retractor and placing the patient in the exaggerated Trendelenburg position after the prostate had been enucleated the field of operation could be inspected torn shreds of tissue cut away so as to reduce subsequent infection and bleeding points ligatured Haemostasis was completed by the insertion of a continuous suture along the posterior segment of the bladder outlet The originator of this open operation hoped by these means to reduce post operative haemorrhage and sepsis to a minimum and to banish entirely that occasional sequel to operation post-prostatectomy obstruction

Ten years have elapsed since Thomson Walker introduced his open operation and experience has shown that it affords no certain guarantee against the occurrence of any of the accidents that its originator hoped to prevent Severe haemorrhage sepsis and post prostatectomy obstruction have all occurred after an open operation Their incidence may be less frequent but none of these accidents has been entirely eliminated and many of us have come to the conclusion that the extra half hour required for the open operation is not justified by the benefits it confers Where speed is necessary the old Freyer operation still remains preferable A glance at the last annual surgical report of St Peter's Hospital in which the results of the various operations performed there during the year are admirably set out serves to confirm this view There it will be seen that the highest mortality rate is that which follows the performance of the Thomson Walker operation Undoubtedly its originator was right in attempting to eliminate the defects of the Freyer operation but unfortunately his efforts to do so have not met with the success that he hoped for

The Harris Technique

To a worker in Australia—namely the late S H Harris (1933 1935) of Melbourne—must be accredited the next serious effort to get rid of the glaring defects of the Freyer technique Dissatisfied with the half measures of Thomson Walker he aimed by means of carefully placed sutures to arrest haemorrhage so completely that the bladder could be closed by primary suture Young's boomerang needle a clever invention that had been originally devised to aid in the difficult task of closing fistulae left by the perineal operation provided him with the instrument necessary to his purpose With the boomerang needle it was possible to take a big bite of the tissues round the prostatic cavity to underpin all bleeding points and to reconstitute the neck of the bladder The suture on which Harris placed most emphasis was a median posterior suture so inserted as to carry a tongue of mucous membrane and muscle deep down into the prostatic cavity This trigonization suture as he termed it served to re form the floor of the urethra Lateral stitches were then inserted in such a manner as to draw together the walls of the cavity and to help to obliterate it Drainage was provided for by an indwelling urethral catheter anchored in position by means of a stitch passed through its eye and brought out through the abdominal wall The bladder was then closed by primary suture Harris claimed excellent results from his operation and published a remarkably low mortality rate That ugly trio of the Freyer operation—haemorrhage sepsis and post prostatectomy obstruction—had apparently been conquered and the author of the new operation waited confidently for his colleagues blessing on the new technique

The urological world was slow to take note of his writings In opening a discussion on prostatectomy at the Centenary Meeting of the B M A held in London in July 1932 Mr Swift Joly commented unfavourably on the Harris operation He expressed the opinion that attempts to perform plastic operations on the prostatic cavity resulted only in an increase of sepsis Other speakers were inclined to agree with him Harris was bitterly disappointed

Soon afterwards the tide began to turn Clifford Morson and Ogier Ward gave his method a trial and later published good results from the new technique Other British urologists followed suit, and at the annual meeting

of the Urological Section of the Royal Society of Medicine a complete reversal of opinion was found to have taken place It was the majority of speakers who now upheld the Harris operation, the minority who opposed it But it was very noticeable that everyone who was using the new operation had considerably modified Harris's technique, one having eliminated the posterior trigonization suture, another the postero-lateral, and a third the antero-lateral Moreover, only a few had dared to follow Harris's lead in carrying out primary closure of the bladder as a routine measure Usually a small suprapubic drainage-tube was inserted and retained during the first few days of convalescence

Present Position of the Harris Operation

Operations are subject to the same laws as those that control other human inventions, at first a new operation meets with a certain resistance, and then if it has any merit it is acclaimed as a great advance that will supersede all other methods Finally it reaches the period of equilibrium or of decline it either takes a permanent place in the repertoire of the surgeon or else sinks into oblivion This I believe will be the history of the Harris technique, but at the present moment I am not prepared to say what the final stage will be I am sure, however, that in the exact form in which Harris planned it his operation will not survive, for it suffers from a great defect, a defect from which the Freyer operation is altogether free In inserting some of the sutures the boomerang needle passes well outside the limits of the urinary tract, and is therefore capable of carrying with it infection—if infection there be—into the cellular tissues of the pelvis That this is not merely a theoretical objection but a very real danger is shown by the fact that practically every operator who has used the Harris technique at all extensively has met with cases of pelvic cellulitis It can of course be urged that pelvic cellulitis may occur after every type of prostatectomy, but the consensus of opinion favours the view that it is more frequent after the employment of the Harris technique This is a very serious objection, and Harris's insistence on the necessity for the careful preoperative treatment of infection does not remove it However carefully we prepare our patients we cannot guarantee that we have rendered the bladder aseptic

A second shortcoming of the operation is that while the lateral sutures certainly diminish bleeding they do not obliterate the prostatic cavity All that they do is to draw the bladder together over the hole left by the prostate, unless, of course, the boomerang needle is inserted so wide that it goes well outside the prostatic capsule Such a big excursion of the needle not only increases the risk of pelvic cellulitis but also when the stitches are tied, turns in a great part of the base of the bladder and causes a marked deformity of that viscus Although Harris himself showed no hesitation in inserting these widely placed sutures I cannot feel that so gross a deformity of the bladder is desirable

Because of these weak points in the Harris operation some of those who had previously adopted it have given it up while others have so greatly modified the method that it can no longer be called a Harris operation My own position is that I still employ a modified Harris technique but only in those favourable cases in which I am fully satisfied that the patient is able to support a longer operation When a two stage operation is advisable or when I feel any doubt about the patient's capacity to withstand a more formidable procedure, I have fallen back again on an operation that in its essentials resembles the old defective method of Freyer For me the technique of Harris, which at one time I hailed as a great advance in prostatic surgery, appears to be a method of definite but of limited utility I look upon it as a portent of things to come rather than as a method that has already arrived It indicates the lines along which we must continue to work—a direction and not a goal

On the Continent and across the Atlantic the Harris method has met with no favour Efforts to advance in prostatic surgery have in the United States taken another direction, more particularly the development of perurethral methods of treatment This important branch of prostatic surgery will now be discussed

Perurethral Operations on the Prostate

Again it will be unnecessary to deal with the foundation of perurethral surgery laid by Bottini, Civiale, Young, Caulk, and Luys, for we are mainly concerned with modern developments After the usual period of resistance this method of dealing with prostatic obstruction received widespread recognition rather suddenly By some enthusiasts it was even proclaimed to be a method that within a decade would entirely replace all others Prostatectomy would then retain merely a historic interest This has only proved to be approximately true in the case of the Mayo Clinic, at which about 98 per cent of prostates are now being dealt with by perurethral methods Elsewhere it has been felt, first, that resection is not a universal substitute for prostatectomy but a valuable alternative to be used in certain cases and, secondly that it is not a minor proceeding immune from all dangers At a very early stage after the spread of perurethral methods disturbing reports of deaths from haemorrhage and sepsis destroyed the illusion that the resectoscope was an instrument that could be used by all and sundry with light hearted enthusiasm Even to the experienced urologist a perurethral resection often proves to be a difficult operation In the hands of the inexpert the resectoscope can be an instrument that is more deadly than the knife Years of practice are necessary in order to become master of it

As in the case of prostatectomy, the chief dangers of perurethral resection have proved to be haemorrhage and sepsis, and it has been to eliminate these, and at the same time to increase the facility with which prostatic tissue is removed, that our efforts have in the main been directed All techniques that entailed the leaving behind of a large area of coagulated tissue have now been abandoned on account of the sepsis that they encouraged Of the many instruments that have been devised two have now definitely gained the ascendancy, these are the McCarthy resectotome and the Thompson punch In this country we prefer a modification of the former instrument, not necessarily because it is the better weapon, but because we find the direct-vision ocular system of the Thompson punch more difficult to use From the point of view of sepsis however, the Thompson punch, which employs a cold knife for cutting and only uses a coagulating current for stopping haemorrhage, is probably the better instrument

On the whole it may be said that in this country urologists have reached an agreement not only as to the best method of carrying out perurethral resection but also as to the indications for doing so Only in America do we find discrepancies of opinion so wide as to result in the perurethral method being used or

exceptionally at one clinic and as a routine procedure in another Here we regard it as a treatment that is suited to certain prostates and to certain circumstances Perurethral resection is no longer on its trial but has established for itself a definite place in the surgery of the prostate

Conclusions

Having surveyed the work that has been carried out by innumerable researchers in the laboratory and in the operating theatre during the last twenty years I feel that we have no reason to be dissatisfied with the results We have made definite progress both in our understanding of the aetiology of enlargement and in our methods of dealing with it The investigations of the biologist and of the biochemist are now leading us in a direction which may well mean that within a few years we shall be able to prevent its occurrence and possibly cure the condition once it has arisen In the meantime close co operation between the clinicians and the designers of instruments has provided us with a valuable alternative method of surgical intervention in the shape of perurethral resection Finally it may be said that even if the efforts of prostatectomists to rid the original Frever operation of its shortcomings have not so far met with success there is no reason to disbelieve that in the end this also will be achieved

The fourth annual meeting of French radio electrologists will be held in the physics theatre of the Paris Faculty of Medicine from October 5 to 8 Professor Joliot-Curie will deliver an opening address on the biological applications of the neutrons and the artificial radio elements including the therapeutical hypotheses concerned Professor Didier will speak on the radiological methods of examination of sections of organisms Professor Baudouin and Dr Fischgold will present a communication on the bio-electrical phenomena of the nervous system and their possible applications in practice Dr Gaston Daniel of Marseilles will discuss radiotherapy as an antidote to inflammation Lectures on various aspects of biophysiology will be given by Professors Lamarque Soula Marques and Strohl of Djourno Visits will be paid to institutes and hospitals and there will be entertainments and excursions Full information may be obtained from Dr Delherm 1 Rue Las Cases Paris 7e

ANAEMIA AND THE GASTRO-INTESTINAL TRACT*

BY

JANET M VAUGHAN D M, M R C P

Senior Assistant in Clinical Pathology, British Postgraduate Medical School

It is recognized to day that the commonest cause of anaemia is a lack of one or other of the essential haemopoietic principles The known haemopoietic principles are (1) iron (2) the P A substance in liver effective in Addisonian pernicious anaemia (3) vitamin C Minute quantities of other minerals such as copper cobalt and manganese may be required for normal haemopoiesis but are usually present in sufficient quantities even in poor diets since only extremely small amounts are needed Thyroxine is often included but its effect is probably an indirect one (Bomford 1938) The body is dependent for its supplies of these haemopoietic principles upon the food ingested and subsequently digested and absorbed in the intestinal canal It is therefore not surprising that there is a close relationship between anaemia and disturbances of gastro intestinal function since abnormalities in food intake digestion and absorption must result in a deficiency of these principles It is essential in treating a patient with a deficiency anaemia to recognize not only the type of anaemia—that is whether it is due to lack of iron liver or vitamin C—but also to determine how the deficiency is brought about so that an attempt may be made to correct the disordered mechanism It must also be remembered that an adequate supply of haemopoietic principles may be converted into an inadequate supply if the demands are increased Thus iron-deficiency anaemias are extremely rare in men unless there is some source of chronic haemorrhage On the other hand iron deficiency anaemias are common in women of the working classes because the iron content of the diet is not sufficient to make good the continuous iron drain of normal menstruation (Davidson and Fullerton 1938)

For purposes of discussion the disturbances of gastro intestinal function that may convert an adequate into an inadequate diet so causing what Castle has called a conditioned deficiency may be grouped as follows (1) haemorrhage (2) deficiency of gastric digestion (3) deficiency of intestinal absorption (4) production of toxic substances So far as is known such factors influence only the utilization of iron and the P A principle There is no evidence that intestinal abnormalities affect the utilization of vitamin C

Haemorrhage

The commonest sources of gastro intestinal haemorrhage are bleeding gastric and duodenal ulcers and haemorrhoids The latter especially in men are an important cause of severe iron-deficiency anaemia It should always be remembered that in tropical countries bleeding from hookworm infestation associated with a poor diet is a possible cause of hypochromic anaemia An analysis of the stools for occult blood is an essential investigation in all cases of anaemia of unknown aetiology

Deficiency of Gastric Digestion

Deficiency of gastric digestion may be due to (*a*) organic lesions (*b*) diminished secretion of hydrochloric acid (*c*) diminished secretion of the intrinsic factor of Castle

* A paper read to the Exeter Division of the British Medical Association on March 10 1938

(a) ORGANIC LESIONS

Within the term "organic lesions" are included new growths of the stomach and complete or partial gastric resection. Such lesions cause anaemia in part by diminishing gastric secretion and in part by altering intestinal function. They respond well, so far as the blood picture is concerned, to treatment with iron and liver extract.

(b) DIMINISHED SECRETION OF HYDROCHLORIC ACID

There is a high incidence of achlorhydria associated with all types of anaemia. It is invariably present in Addisonian pernicious anaemia, and is often found in iron deficiency anaemia of women and infants and in anaemia associated with hookworm infestation, sepsis, and nephritis. It was thought at one time to play such an important part in the aetiology of the iron deficiency anaemias that the type occurring in women was called by some workers "achlorhydric anaemia". The evidence available to-day suggests that inability to secrete acid favours the development of iron deficiency, especially when the diet is defective, but that iron deficiency often occurs when the acid secretion is excellent. Barer and Fowler (1937) have recently made elaborate iron-balance observations on people with and without achlorhydria. They found that people with achlorhydria retain less iron on an ordinary diet than those without achlorhydria. Medicinal doses of hydrochloric acid do not increase retention. It must be remembered, however, that such acid is quickly neutralized by the stomach contents. If food is given buffered to an acid *p*H (Mettier and Minot, 1931) iron is more readily absorbed than if it is given buffered to an alkaline *p*H. Barer and Fowler (1937) found that when large quantities of iron are given the amount retained was unaffected by the gastric acidity, being the same approximately in people with normal acid secretion and in those with achlorhydria. These observations suggest, therefore, that in practice the use of hydrochloric acid will not help the absorption of iron either from the ordinary diet or from medicinal supplies. It is, however, impracticable and also unnecessary to give a diet buffered to an acid point, since medicinal iron administered in large amounts appears to be well absorbed.

As a result of their observations Barer and Fowler suggest that in iron deficiency anaemias there may be a lack of some as yet unidentified substance in the gastric secretion. Evidence on this point is at present conflicting and unsatisfactory.

(c) DIMINISHED SECRETION OF THE "INTRINSIC FACTOR OF CASTLE"

Addisonian pernicious anaemia is dependent upon a deficiency of such a substance, called by Castle "the intrinsic factor". In a series of classical experiments Castle showed that if beef-steak was fed to patients with pernicious anaemia the blood picture was unaffected. If normal gastric juice was fed the blood picture was still unaffected, but if beef-steak predigested with normal gastric juice was given the blood picture became normal. Predigestion with gastric juice from patients with pernicious anaemia, or with hydrochloric acid and pepsin alone, was ineffective. He concluded, therefore, that the fundamental abnormality in pernicious anaemia was an inability on the part of the stomach to secrete some principle essential for the digestion of certain foodstuffs and the consequent elaboration of the active liver principle. It is probable that inability to secrete the intrinsic factor is not absolute—that is that some patients are able to excrete small quantities and that the amount may vary from time to time (Goldhamer 1936). This would account for the occurrence of spontaneous remissions before the days of liver therapy. Goldhamer (1936) goes so far as to suggest that there is a constant relation between the blood level and the volume of gastric secretion. The cause of this inability to secrete the "intrinsic factor" remains obscure. Gastroscopic examination of the stomach shows atrophic gastritis affecting the fundus and cardiac portions in pernicious anaemia and to some extent in iron-deficiency anaemias. Histological examination of the stomach in pernicious anaemia shows atrophy both of mucosa and of muscle coats (Magnus and Ungley, 1938), affecting the fundus and cardiac portions only. Since all experimental evidence (Meulengracht, 1935) suggests that the intrinsic factor is secreted by the pyloric glands and Brunner's glands, this anatomical abnormality is at present difficult to interpret. There is no evidence that after treatment the power to secrete the intrinsic factor ever returns to normal, though it may improve slightly. Goldhamer (1937), who has estimated the quantity of gastric juice before and after liver treatment, has obtained only an insignificant increase. The average gastric-juice volume in normal subjects he found was 150 c.cm. per hour, in pernicious anaemia patients it was 20 c.cm. in relapse and 46 c.cm. in remission. It is therefore essential to continue treatment with liver extract indefinitely in true Addisonian pernicious anaemia.

Anaemias associated with gastric dysfunction are usually simple—that is, there is lack of the P.A. factor alone or of iron alone. Therapy takes the form therefore of either liver extract or iron. This is true particularly of iron deficiency. In practice it is sometimes found that patients with Addisonian pernicious anaemia have also some degree of iron deficiency. The red cell count reaches a level of 4,000,000 per c.mm. or slightly higher when liver extract is given in adequate doses, but even with increased dosage it will not rise further. Treatment with large doses of iron in addition to liver extract however will often result in satisfactory haematological improvement. Realization of this is important, since it is absolutely essential, if subacute combined degeneration is not to develop or grow worse when already present that a red cell count of 5,000,000 per c.mm. and a haemoglobin of 100 per cent. should be maintained in all patients with Addisonian pernicious anaemia.

Deficiency of Intestinal Absorption

It is known that in many patients hyperchromic anaemia responds better to liver extract given by parenteral injection than to liver extract given by mouth, while anaemia is often found in association with various disturbances of intestinal function. It is concluded, therefore, that failure to absorb haemopoietic principles may play a part in the development of anaemias. The following abnormalities of intestinal function are thought to hinder absorption: (*a*) changes in the *p*H of the intestinal contents, (*b*) increased motility, (*c*) abnormalities of muscle tone, (*d*) abnormalities of intestinal mucosa.

(a) CHANGES IN *pH*

Gastric secretion of hydrochloric acid, so far as is known at present, regulates the *p*H of the intestinal contents. Evidence showing that small doses of iron are better absorbed from an acid medium and that unless food is given in a buffered medium it is impossible to alter the *p*H of the intestinal contents has been already discussed.

(b) INCREASED MOTILITY

Increased motility of the intestinal contents is a more frequent cause of anaemia than is generally recognized Following gastric operations such as gastro enterostomy gastrojejunostomy or partial resection anaemia often develops Many studies have been made as to the cause of this anaemia but only one abnormality has been demonstrated to occur at all constantly Hartfall (1934) found in a large series of such cases that on screening a barium meal appeared to fall through the small intestine—that is there was greatly increased motility Little time is available therefore for absorption of essential principles when they occur in normal amounts If given in large quantities they are apparently absorbed more easily The mechanism of this increased absorption in the presence of large amounts is not clear Such increased motility is probably a factor also in the production of the anaemia of sprue and the anaemias associated with severe diarrhoea of any type

(c) ABNORMALITIES OF MUSCLE TONE

In the case of sprue abnormalities of muscle tone and movement have been demonstrated during a relapse and have been shown to be absent during remissions (Mackie Miller and Rhoads 1935) No increased motility was demonstrated, but in a series of seventeen cases the following changes were almost invariably present

(i) Great variation in contour and size of the lumen (ii) segmentation of the column of barium (iii) pocketing of barium (iv) mucosal changes shown by a distorted mucosal pattern Studies by barium enema frequently demonstrated a dilated and somewhat redundant colon Following treatment, considerable if not complete improvement was noted Since many patients with sprue respond better to liver extracts when given by injection than when given by mouth it is thought that some failure of intestinal absorption must be present probably dependent at least in part on these demonstrable changes in muscle function

(d) ABNORMALITIES OF THE MUCOSA

Anaemia is common in all forms of colitis Here probably mucosal as well as muscular abnormalities play their part in hindering absorption of essential foodstuffs

In idiopathic steatorrhoea there is failure to absorb many essential substances from the intestinal canal not only haemopoietic principles The cause of such failure remains obscure Other intestinal abnormalities such as multiple resection multiple adhesions stenosis of the canal or fistula formation may all result in anaemia presumably through interference with intestinal absorption through one or other of the abnormalities discussed

It has been suggested that lack of ascorbic acid may result in a failure of intestinal absorption especially of iron It is known that apart from glutathione ascorbic acid is the most powerful reducing agent present in the body (Hopkins and Morgan 1936) The mucosa of the small intestine is unusually rich in ascorbic acid and since iron is absorbed in the ferrous form it has been thought that a deficiency of this powerful reducing agent in the intestinal canal might result in a failure to absorb sufficient quantities of iron (Macfarlane 1936) This view however at present lacks any direct experimental support

The changes in intestinal function already discussed might be expected to affect the absorption of many substances simultaneously rather than to exert a selective action This is often found to be the case A mixed type of anaemia is common in anaemias of intestinal origin—that is there is a deficiency of both iron and the P A principle The recognition of such a dual cause may sometimes direct attention to the intestinal canal when a lesion there has not been suspected Stained blood films in such cases show the small pale cells containing little haemoglobin which are characteristic of iron deficiency anaemias together with the large well coloured cells full of haemoglobin which are characteristic of P A deficiency anaemia Such cases require treatment with both iron and liver Their recognition therefore important When such a picture is seen in the stained film an intestinal abnormality should at once be suspected A special examination should be made in all patients with a known gastro intestinal lesion to discover if this dual deficiency is present It may occur with only a mild degree of anaemia but administration of both liver and iron in such cases will result in remarkable clinical improvement Such treatment has to be continued indefinitely since it can only replace a deficiency and does not affect the disturbed mechanism

Production of Toxic Substances

Recent experimental work has shown that the production of toxic substances in the intestine associated with a deficiency of certain food substances in the diet may cause anaemia possibly of a haemolytic type It may be necessary in the future to think in terms of conditioned toxicities as well as of conditioned deficiencies Rhoads (1937) found that when he fed indol to dogs on a normal diet the dogs remained well, but when he fed indol to dogs on a deficient diet a severe anaemia rapidly developed This was cured by liver extract and its onset prevented by the addition of liver to the diet Indol is a substance which may be present in the normal intestine and under some circumstances may occur in large amounts These observations are too recent to enable us to do more than note them They serve however, to emphasize the extraordinary importance of an adequate diet in maintaining normal health and are a yet further indication of the close relationship of normal gastro intestinal function to normal haemopoiesis

Cremation as the most hygienic means for disposal of the dead was advocated by Dr W G Clark deputy medical officer of health for Edinburgh at the joint conference of the National Association of Cemetery and Crematorium Superintendents and the Federation of Cremation Authorities in Great Britain held in Edinburgh last week Dr Douglas Kerr medical referee to the Edinburgh Corporation said that cremation was advancing so rapidly becoming so widespread and such extensive practical experience of the working of the present Act had accumulated that fresh legislation could be foreseen in the near future

FURTHER OBSERVATIONS ON BENZEDRINE

BY

E W ANDERSON, M D, M R C P, D.P M.

The interest in benzedrine, particularly in its use in psychiatry, would seem to justify yet another contribution to the literature The following is an account of a study of the effects of benzedrine, over a period of fourteen months or so, on a group of patients at the Cassel Hospital who were suffering chiefly from the minor forms of mental disorder

Thirty-three patients in all were given benzedrine orally in doses ranging from 5 to 45 mg In addition, eight normal subjects were given the drug Among the patients twenty-one were male and twelve female The diagnostic grouping was as follows twenty-eight depressives, two "anxiety states," three schizophrenics, and one organic (manic-depressive with disseminated sclerosis)

At the beginning of this study the pressor effect of the drug was studied as well as its central effects, and careful observations of the blood pressure and the mental state were made throughout the day The blood pressure was taken each morning at 9 o clock, in the lying and standing positions, the third reading being taken in each case The drug was then given, the variations in dosage being concealed from the patient by using tablets of a neutral substance (calcium lactate) as well, so that the same number of tablets was given each time The normal variations of the blood pressure in the individual were also determined These observations presented nothing new, and will not be discussed further After a time, therefore, we ceased to study the blood pressure alterations and devoted our interest entirely to the psychological changes, and it is these which form the main topic of this paper

After Davidoff and Reifenstein s (1937) excellent paper and a recent leading article on benzedrine in the *British Medical Journal* (1937) it is unnecessary to review the literature at length The two main effects of this sympathomimetic drug—the pressor and the central action—are now familiar Its use in narcolepsy (Prinzmetal and Bloomberg 1935, Ulrich, Trapp, and Vidgoff, 1936), post-encephalitic Parkinsonism (Solomon, Mitchell, and Prinzmetal 1937) intestinal spasm and hence its employment in gastro intestinal radiology (Myerson and Ritvo, 1936), as a vasoconstrictor in rhinology (Scarano and others, 1934) and its effect on the gastric juices (Myerson, Rinkel, and Dameshek 1936) now require no further mention A more recent non psychiatric use is in orthostatic hypotension (Korns and Randall 1937) in which favourable results have been observed it seems, however, inferior to ephedrine in the treatment of this condition Although containing a benzene ring no effect on the blood constituents has been observed either at the time or months later (Schube, Raskin, and Campbell 1937) although before this Myerson, Loman, and Dameshek (1936) had reported dramatic changes, including a polycythaemia in some cases, as well as a striking leucocytosis It would appear that still further work on this problem is required in view of these observations So far as its use in psychiatry is concerned there is fairly general agreement as to its effects, the change of mood in the direction of elation, removal of inhibition fatigue and so forth call for no further mention, but before discussing the psychological effects in greater detail the present results will be considered

The Present Investigation

The patients have been grouped in three categories (1) those showing no change mentally or physically after taking benzedrine (Table A), (2) those who appeared to benefit by it, including those cases in which the beneficial psychological effect outweighed any unpleasant physical sensations which may have occurred (Table B), and (3) those in whom it was necessary or desirable to discontinue the drug because of untoward effects or because it proved of no value (Table C) In an earlier paper I described with Dr Scott some unfavourable cardiovascular complications, the most notable of which was a transient heart block These experiences made us for a time exceedingly cautious in dosage, but we now believe this case to have been exceptional and in view of increased experience with benzedrine, together with the fact that others—for example, Prinzmetal and Bloomberg (1935)—have now given the drug continuously for long periods, in some of their cases for over a year, without mishap we have not hesitated to give larger doses Nevertheless I consider there is still need for caution in its administration and more detailed investigation of its cardiological effects in particular I agree with Davidoff and Reifenstein (1937) that it is best given under supervision in a hospital So far, despite the comparatively large amount of work which has been done, the drug is still in the experimental stage

TABLE A

No	Sex and Age	Diagnosis	Maximum Dose	Duration	Unfavourable Physical Symptoms	Psychological Symptoms
1	M aged 49	Recurrent depression (third) with paranoid features and much retardation	30 mg	One month	None	No change During period of severe retardation no change
2	F aged 34	Schizophrenia (catatonic stupor)	20 mg	One occasion	None	No change
3	M aged 44	Depression with hypochondriasis	10 mg	One day	No change	No change
4	M aged 49	Depression (agitated self accusatory)	20 mg	Two days	No change	No change
5	F aged 56	Depression (retarded)	20 mg	One day	No effect	No effect

Of the total number of patients to whom the drug was given, in fifteen or just under one half, it was found necessary or desirable to discontinue the drug In two others the drug appeared to be of no value and was discontinued essentially for this reason Some undesirable symptoms also occurred in these patients, but they were not severe enough in themselves to have justified discontinuance of the drug had there been a concomitant psychological effect of any value One patient a man (C 10), was the 'organic case' mentioned above the other, a woman, was a case of anxiety state (C 11) with numerous phobias, who had been depressed for a day or two and for whom it was thought the drug might have a beneficial effect in tiding her over this crisis In eleven

TABLE B

No	Sex and Age	Diagnosis	Maximum Dose	Duration	Unfavourable Physical Symptoms	Psychological Symptoms	Remark
1	F aged 27	Depression with obsessional and hysterical features	10 mg. Usual dose 20 mg.	Twice or thrice weekly for one year	Felt shaky. Tingling sensation over head and body. Tachycardia. Tingling sensation later got worse and she felt her heart nearly choked her. Anorexia. Pains over loins. Strangled feeling and palpitation.	Felt lively — tranquil feeling. Feeling of lightness and happiness. Sense of remoteness. Time seemed pass more quickly. Feeling of confidence and loss of self-consciousness (in particular sexes). After small or moderate doses marked decrease in depersonalization with larger doses feels drawn out of self more absorbed and more	On the whole a beneficial effect.
2	M aged 46	Depression with obsessional features (Phases of severe agitation)	30 mg.	Twice	Shakiness in legs. Dry mouth. Feeling of film on tongue noticed two hours after ingestion of drug. Later tongue felt dried up.	More composed. Treading on air. Light headed. Alteration of time experience — felt he was living in the present. Felt for first time his illness was really his fault. After 30 mg. felt as if he had had alcohol but with difference that head was clear. Later felt drowsy but on questioning this was shown to be more a feeling of absolute control. Obsessional preoccupation over bad dreams and bowels diminished. Increased talkativeness. Likes and dislikes for people heightened.	Definite beneficial effect. Disappearance of depersonalization. Definite improvement in mood. Had a bad night after.
3	M aged 33	Schizophrenia (Earlier acute attack with hallucinosis and paranoid features—now disappeared)	20 mg.	Regular for one month	None.	More toned up physically. Drive. More energy.	Doubtful whether psychotic symptoms which could be attributed to drug.
4	M aged 60	Involutional depression with prominent hypochondriasis	45 mg.	Sixty two days.	Severe pain in occipital region (probably of same nature a similar sensation associated with illness). Tachycardia and consciousness of heart's action which he interpreted as a good sign as against former unawareness, which he felt indicated trouble with heart.	Queer feelings in scalp modified favourably by drug. More cheerful. Feeling it was unnatural — not himself. After 10 and 25 mg. very elated and talkative.	Effect variable. After several days drug began to lose effect. Effect of B. benzedrine after a time. Effect of withdrawal of drug. Withdrawal of drug would probably be impossible.
5	F aged 41	Depressive psychopath with periodic severer depression with suicidal ideas, heavy spirit drinker taken to overcome inhibition	30 mg.	Frequent occasions over period of two months	Heavy feeling in epigastrium. Consciousness of heart's action.	Felt more relaxed, less depressed. More inclined to talk to people. Less energy than with alcohol. Did not regard drug as so effective. Felt drug enabled her to go through task more easily. Toward end of treatment with drug felt more depressed than usual when effect passed off — ? usual constitutional intensification of mood. This seemed more probable.	On the whole the drug had been a bad effect.
6	M aged 49	Depression with hypochondriasis (first attack)	10 mg.	Three isolated occasions, then continuously some months later for twelve days.	Increased feeling of pressure in head when drug (first course) given. When second course given some months later this symptom was not made worse.	Talked more. More assurance. Spirits risen 100 per cent. Felt a little drunk. Depression increased five hours after one dose.	On the whole had a beneficial effect.
7	M aged 28	Recurrent depression with prominent anxiety with phobias, etc.	10 mg.	Three occasions.	Palpitation and sweating. Tremulousness.	Felt drowsy and heavy headed. Alteration of time perception in direction of normal — recent past events seemed more vivid.	Doubtful whether beneficial effect.
8	M aged 51	Recurrent depression with obsessional features	30 mg.	Five weeks (thirty five days)	None.	Absolutely right as rain one might say too high all my trouble fell away. After five days on 15 mg. thought drug losing effect. Dose increased to 30 mg. and this has been steadily effective since.	Action variable in psychosphere but almost entirely favourable effect. Duration of period between dosage and psychic effect — varied.
9	M aged 49	Depressive (first attack) with obsessional colouring — i.e. inability to make decisions	10 mg.	On isolated occasions during one month.	None.	More cheerful. Not so tense. More talkative, confident, and hopeful. Felt he could deal with his problem better.	Administration of drug encouraged with definite and progressive clinical improvement.
10	M aged 49	Recurrent depression (second) self-reproach, feeling of inadequacy.	20 mg.	Two occasions.	Slight headaches and giddiness.	Drowsiness and heaviness. Seemed easier in the eyes. More confident and self reliant.	Great relief of [illegible] and much easier and [illegible] much [illegible].
11	M aged 49	Recurrent depression (second). Emotional instability, inability to concentrate. ? early organic. (Suffered from asthma)	30 mg.	Isolated occasions at first. Regularly for first night also after discharge.	Felt wobbly. Asthmatic symptoms improved and breathing easier. Some blurring of vision. Limbs ached. Slight headache.	Felt a little low. Rather more cheerful. After 30 mg. feeling of euphoria. More talkative. Feeling of depersonalization. Alteration of time percept on (time seemed to go faster). Concentration improved.	Beneficial effect after discharge (20 mg. per day). Effect of same dosage varied.

TABLE C

No	Sex and Age	Diagnosis	Maximum Dose	Duration	Unfavourable Physical Symptoms	Psychological Symptoms	Remarks
1	M aged 51	Chronic depression with depersonalization	20 mg	Three times	Slight headaches and dizziness Anorexia	Head slightly clearer Felt more tired and was unable to concentrate so well	
2	M aged 35	Depressive with hysterical features	10 mg	Four occasions	Dizziness Legs felt heavy	Dazed More depressed	
3	F aged 29	Anxiety state (palpitation acid dyspepsia some phobias etc)	10 mg	One occasion	Dizziness Later palpitation headache and nausea Increased lability of blood pressure and some extrasystoles	No change in mood	
4	F aged 35	Mild manic depressive	20 mg	On isolated occasions during one month	Severe headache Pain from chest upwards and including all face Intermittent spells of giddiness (? entirely due to drug as she had reported this before) They ceased immediately after drug to reappear at intervals	Less tense Body felt more comfortable Mind worked very actively and poor sleep	Dubious value so discontinued
5	M aged 29	Depression with self-reproach Feeling of inferiority etc	10 mg	One occasion	Headache Tremulousness	Felt frantic More self reproachful two and a half hours later felt calmer then one and a half hours later still shaky and complained of headache Some diarrhoea	No beneficial effect
6	M aged 35	Depressive psychopath obsessional and paranoid features	10 mg	Several isolated occasions	Head throbbing Giddiness	Made head a bit more clear I think I feel more gives me a little more brightness More self confidence After two or three doses asked that it should not be given him again as it made him feel unnatural and excited	Left hospital as he refused to continue treatment with drug
7	M aged 29	Recurrent depression with obsessional features	30 mg daily	Twenty two days	Complained of heavy sensation in epigastrium *Marked fall in weight* (physical examination revealed no reason) Anorexia more marked	Indecision less after drug Felt he could concentrate better more energy *Brain more active* Pleasant thoughts Days passed more quickly than before To wards the end of period effect seemed to wear off and symptoms became relatively more prominent for which patient blamed the drug Fatigue	Discontinued chiefly owing to loss of weight which it was felt might be due to the drug
8	M aged 49	Involutional depression with paranoid features	30 mg	One occasion	Transient heart block	Calmer Lived more in the present Did not think so much about his trouble	Reported in earlier article
9	F aged 47	Depression with hysterical features	20 mg	One occasion	Tachycardia Vision blurred and felt shaky Numb feeling down the arms	Felt brighter	
10	M aged 46	Manic depressive with disseminated sclerosis	40 mg	Continued for one month	Feeling of constriction in neck Unsteadiness of gait Dizziness and nausea	No change in mood Felt if anything a bit more lethargic and unreal	
11	F aged 46	Anxiety state phobias etc	15 mg	Four times	Skin dry and hot Hot and tight in head	Brain worked all night and raced from topic to topic No change in mood	Given during a brief period of depression lasting two days or so
12	F aged 52	Involutional depression with hysterical features	20 mg	One occasion	Severe sympathetic reaction Faint Nearly collapsed Extrasystoles	No change	Case reported in earlier article
13	M aged 29	Manic depressive with depersonalization	20 mg	Two days		Dazed unsteady and headache	Increased activity
14	F aged 56	Manic depressive Hypochondriasis Pain in head and face	20 mg	Two days		Giddy and drunk	No effect
15	F aged 38	Manic depressive Hypochondriasis	20 mg	Four days	Palpitation and nausea	Talked with greater ease	
16	M aged 24	Schizophrenia Depressed tense hypochondriacal	20 mg	One day	Pain in chest	No change except exacerbation of hypochondriasis	
17	F aged 24	Depression (retarded)	20 mg	Two days	Dazed	*Some days later said inner excitement had been present*	

of the patients (one-third) a beneficial effect could be claimed in some cases with reservations In two of them the benefit was somewhat dubious one (B 7) was a man of 28 with mild depression and depersonalization with some phobias and anxiety features palpitation, sweating and tremulousness which were increased as might have been expected This is in accord with Guttmann and Sargant's (1937) observations of the effect of the drug in anxiety conditions The other (B 3) was a schizophrenic in whom there was a slight clinical improvement which seemed doubtfully due to the drug Nevertheless he thought it "toned him up

Physical Symptoms

Of the eleven patients who appeared to benefit from the drug only three had no physical symptoms—that is the drug appeared to exert its effect in the psychic sphere alone Of these three, one had 30 mg daily for a month,

TABLE D—*Normal Controls*

No	Sex and Age	Maximum Dose	Duration	Unfavourable Physical Symptoms	Psychical Symptoms
1	M aged 35	20 mg	Once	Palpitation Pains in left chest and in left axilla Shakiness in walking Sweating increased Absence of fatigue	Thinking quick and easier Appreciation of humour Less reserve Feeling of well-being Time seemed to pass more quickly Sexual attitude towards wife the opposite sex was remarked Feeling of being [illegible] every situation Self-confidence increased but [illegible] ready to overestimate Feeling of well-being and energy Feeling of [illegible] an hour after taking drug
2	F aged 46	20 mg	Once	Felt changes in sensation in finger tips and muscles of jaw Giddiness Tendency to walk to left Difficult to keep a straight line Blurring of vision Got tired of holding teacup it was an effort to eat	Slightly apprehensive More alert All round happier than usual
3	F aged 35	20 mg	Once	Some swimmingness on lying down Tingling sensation in legs Breathlessness and dizziness. Anorexia tiredness later some dimness of vision momentary some abdominal discomfort. Dry mouth Decreased micturition	Elation Increased output [illegible] energy mental and physical
4	M aged 46	20 mg	One day	Fullness in head Nausea. Tiredness Feeling of nausea day after test Increased frequency of micturition	Full of beans More [illegible] and energetic Time passing more quickly Less reserve
5	M aged 34	20 mg	Three days	Pain in chest	Increased activity
6	M aged 35	20 mg	One day	Pain in chest	Increased activity cheerfulness and [illegible] talkativeness
7	F aged 23	20 mg	Twice	None	None
8	F aged 19	30 mg	One month	Some anorexia	None

the second 10 mg on isolated occasions during a similar period and the third the schizophrenic already mentioned 10 mg daily for a month In the other eight it was considered that the favourable central effect outweighed any physical phenomena which may have appeared though these in several cases were quite unpleasant In five cases no mental or physical change was noted Two of these (A 1 and 5) were depressives with much retardation Here the result was in accordance with what Guttmann and Sargant have found in this type of case Another was a case of catatonic stupor (A 2) All the controls except-one had physical sensations some of them unpleasant

The principal symptoms were headaches giddiness and cardiovascular symptoms—for example tachycardia pains in chest extrasystoles and the case of heart block already reported elsewhere Two patients complained of a heavy feeling in the epigastrium possibly due to an increase in gastric acidity Four complained of blurred vision including two of the normals five complained of anorexia including three normals—one of the patients (C 7) showing this symptom had complained of anorexia before but it became definitely worse while the drug was given This patient was also the only one of the series to show a notable loss of weight (over a stone) which might have been secondary to the anorexia but may also have been an effect of the drug Davidoff and Reifenstein found a loss of weight in most of their subjects Physical examination in this case failed to reveal any cause for it These results are all the more noteworthy when the relatively small dosage used in most cases is taken into account, One normal subject (D 4) had decreased frequency of micturition the other (D 5) also normal increased frequency One patient (B 2) complained of a sensation he described as a film on his tongue One patient reported diarrhoea (C 5)

Psychical Effects

So far as the effect of the drug on different psychiatric conditions goes the best results were obtained with the depressives It seems impossible to predict what patients will benefit by the drug It seems as if the drug were perhaps of greatest value in the terminal stages of a depression—that is when clinical improvement has already appeared This was true of several of our cases and is again in agreement with what Sargant and Guttmann had found These authors are diffident of giving the drug to patients with prominent hypochondriasis but in some of the patients of this series the hypochondriacal symptoms were beneficially modified however temporarily and it seemed in one case the only form of therapy known likely to prove of much value It enabled this patient (B 4) to face a medical board and perhaps even to launch him again on his duties In another case (B 3) a depressive psychopath who had been accustomed to take large quantities of alcohol to overcome her inhibition and enable her to do her work it was hoped to replace alcohol by benzedrine This was unsuccessful In this context it may be mentioned that Wilbur MacLean and Allen (1937) found it gave marked relief to the craving in chronic alcoholics acting as a supplementary stimulant over a period of months A subjective alteration of time experience was noted in a number of cases (Table B) One or two of the patients complained that the drug made them feel unnatural and one of these (C 6) implored me to give him no more of the drug although he admitted the beneficial psychic effect He finally left the hospital in order to escape the treatment One or two others although admitting benefit were unwilling or reluctant to have any more—an odd and probably unique situation in therapeutics Others again—as might be expected depressives—*while admitting benefit pointed* out that it was after all a drug and they did not wish to be dependent on this an attitude precisely similar to that adopted by many such patients towards the necessary sedatives to procure sleep

With regard to sleep the results were very variable Several on the larger doses 30 to 40 mg a day slept well even when the drug was given at midday Moreover the sleeplessness when it occurred was usually not a painful or unpleasant experience In general the effect observed on sleep was similar to that found by other workers and needs no further comment Four patients felt drowsy or dopy after the drug and two felt fatigued In one

or two cases there was an increase in the depression when the effect of the drug was wearing off, and it is important to bear in mind that Davidoff and Reifenstein mention a case of manic-depressive illness in which the patient impulsively attempted suicide One of our patients (the alcoholic depressive) became very much more depressed, and the question of suicide was uppermost in our minds for some days, and in another (C 5) the depression was considerably intensified This might, of course, just as well have been a usual constitutional intensification in the first case, but it appeared to be a definite effect of the drug in the second

Comment

It must be admitted that, so far at least as these results are concerned, it is difficult to claim any great therapeutic value from benzedrine Nevertheless, if its use relieves the depressed patient even transiently and gives him a few hours' respite, the drug has a place in psychiatry To claim more than this from it at the moment, however, is impossible, and there are many limitations to its usefulness, not the least of which is the variability of its action A small minority of cases seem to benefit definitely from benzedrine, and its greatest usefulness perhaps is in those cases of depression in which a clinical improvement has already set in Here it may be helpful in giving the patient a temporarily increased insight, which has been of use psychotherapeutically Apart from this, the drug is of doubtful value as an aid to psychotherapy It was difficult to resist the impression in one or two cases that the speed of convalescence from a depression was increased, but this is difficult, if not impossible, to establish objectively *Indeed it* is almost impossible in many cases to separate the changes of the normal process of recovery from the effect of the drug, which makes any pronouncement of its value in such cases very dubious For those patients who have clinically improved but who for economic or other reasons are unable to stay in hospital and must return to work, benzedrine is sometimes of help in enabling them to face their day's work The drug should, however, be controlled by frequent examination of the patient afterwards For those depressed patients who may at any time get worse, and perhaps contemplate suicide, suitable doses of benzedrine may enable one to keep them in a hospital or even in everyday life without extra supervision Here, again, they should not be given a bottle of tablets and allowed to go their way

With regard to dosage, 10 to 40 mg in ordinary cases should be enough, and a divided dosage—say, 15 mg at 9 a.m. and a further 15 mg at 11.30 a.m.—is to be recommended, and certainly, unless the patient is under full in-patient supervision, this dosage should never be exceeded The drug is admittedly still in its experimental stage but enough work has now been done to make it doubtful how far, if at all, it is likely to be of greater value in psychiatry than it is at present The contra-indications are now being established, but from my experience it would appear to be unwise to give benzedrine to any subject with cardiovascular disease in any form, or to those with prominent anxiety symptoms The initial dose should not exceed 10 mg and the optimum dose should be determined carefully I agree with Davidoff and Reifenstein that it should be used cautiously in certain depressives because of the possibility of intensifying the depression with consequent suicidal risk This risk has not been sufficiently stressed

Summary

Thirty-three patients suffering from different forms of mental disorder and eight normal subjects were given benzedrine orally in doses of from 5 to 45 mg In sixteen the drug had to be discontinued because of untoward effects, mental or physical, and in two more because no beneficial effect was produced In eleven (one-third) the drug appeared to be helpful In five no effect, mental or physical, was produced Dosage, contraindications, and the general value of benzedrine in psychiatry are discussed

I should like to thank my colleague Dr W C M Scott for having furnished me with his observations on several patients in this series and some of the controls, and also for much valuable help in the preparation of this paper

I would like also to thank Messrs Menley and James, the distributors, for supplying me with a generous supply of the drug with which to carry on this work

THE USE OF PLACENTAL EXTRACT IN AN EPIDEMIC OF MEASLES

BY

T. N. PARISH, M.A., M.D.,

Medical Officer to Benenden School

This is an account of an epidemic of measles in a girls school in which placental extract was used as a prophylactic

The girls vary in age from 13 to 17 years. There had been no such epidemic in the school for nine years and at the beginning of the Easter term 1938 of the 205 girls under my care eighty nine had not had measles. *On January 18 a few hours after the return to school* one child was found to be in the incubation stage of measles. She came by the school train and school bus so that contacts were widely spread throughout the school. Prophylactic measures were discussed and in view of the difficulty of obtaining convalescent serum it was decided to use placental extract in an attempt to modify the subsequent attacks and to lower the complication rate. Moeller (1937) maintains that this extract is as efficacious as convalescent serum and of greater prophylactic value than adult serum. Parents were circularized and forty-seven asked that their children should be given the injection, some of them requesting that this should be done at once. When the time of injection was left to our discretion the injection was given as soon as a case occurred in either the girls' house or form. All were given between January 27 and February 16. The term ended on April 3.

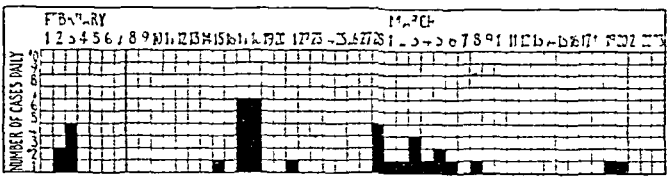

FIG. 1.—Unmodified cases (36).

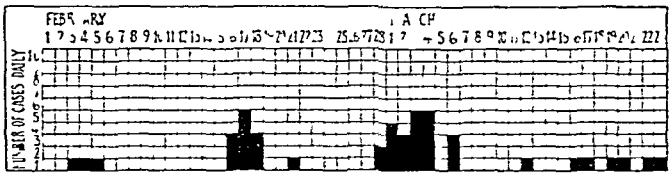

FIG. 2.—Modified cases (44).

Dose and Reactions

The extract used was Lederle's immune globulin and it was given in one intramuscular injection of 4 c.cm. into the buttock. There were no immediate reactions but after a few hours stiffness and some pain at the site of injection were usual. The stiffness persisted for about two days. One child had a temperature for twelve hours but in no case was there constitutional disturbance of any severity nor did any delayed reactions occur.

Course of the Epidemic

The case incidence throughout the term after the initial infecting case (which is not included in these statistics) is given in Figs. 1 and 2. Fig. 1 shows the day of onset of rash in the unmodified cases and Fig. 2 the day of onset in the modified cases.

Taking into consideration the larger number of cases in which the prophylactic injection had been given it does not appear that the extract had any effect in delaying the onset of the attack.

By the end of the term seventy five of the eighty-nine susceptibles had developed measles as well as five of the 116 said to have had measles previously of whom two had also received a prophylactic injection. The distribution of cases in the modified and unmodified groups is shown in Table I.

TABLE I.—*Incidence of Measles*

	Previous Measles (116 Cases)		Susceptibles (89 Cases)	
	Modified (2 Cases)	Unmodified (114 Cases)	Modified (75 Cases)	Unmodified (14 Cases)
Measles developed	2	3	42	33
No measles	0	111	3	11

It is obvious that the extract had no effect whatsoever in preventing the attack of measles. On the contrary the above figures show that among the susceptible cases measles developed in 93 per cent. of those who had been given the modifying injection and in only 75 per cent. of those who had not. The two children who had previously had measles and who had also been injected both developed measles.

The epidemic was of moderate severity although there was a most remarkable freedom from serious complications. Temperatures of over 103 were present in 66 per cent. of the total cases. The only complication of any severity was one case of suppurative otitis media.

Effect of Extract on Attack

The effects of the prophylactic injections were much more noticeable in the first half of the term. It is not possible to convey a clinical impression by statistics but the impression received by all observers was that those cases in which the attack developed within three to four weeks of the injection suffered far less constitutional disturbance. A few of these showed a slight rash of small discrete papules with no tendency to coalesce but on the whole little difference was observed in the rashes of the modified and unmodified cases. The most noticeable feature of the recently modified cases was that although the temperature was high and a well developed rash was present *the patient remained surprisingly* cheerful and undisturbed and did not present the typical woebegone facies and prostration.

The cases were classified (Table II) as they occurred as mild, moderate or severe this classification being based on the degree of constitutional disturbance. This is necessarily a somewhat arbitrary classification for the degree of disturbance did not appear to have any relation to the temperature or nature of the rash.

The effect of the extract in reducing the severity of the attack is most noticeable in those cases in which it had been given within three weeks of onset of rash.

a century of association

There are abundant grounds for the belief that DINNEFORD'S continues to enjoy the approval and patronage of the Medical Profession as surely as when—over a century ago—it was originally prepared at the request of the most prominent practitioners of the day

MANDECAL

(Compound Calcium Mandelate B.D.H.)

In Pyelitis of Pregnancy

Experience in clinical practice has now established beyond doubt that by the use of Mandecal the nausea which is often set up by mandelic acid preparations is almost entirely eliminated. Mandecal, therefore, is ideal for administration in pyelitis of pregnancy.

Further, in Mandecal the immiscibility of calcium mandelate has been overcome, and a pleasant, palatable suspension is easily formed by stirring the powder in water. As with preparations of ammonium mandelate, the collateral administration of ammonium chloride is rarely necessary.

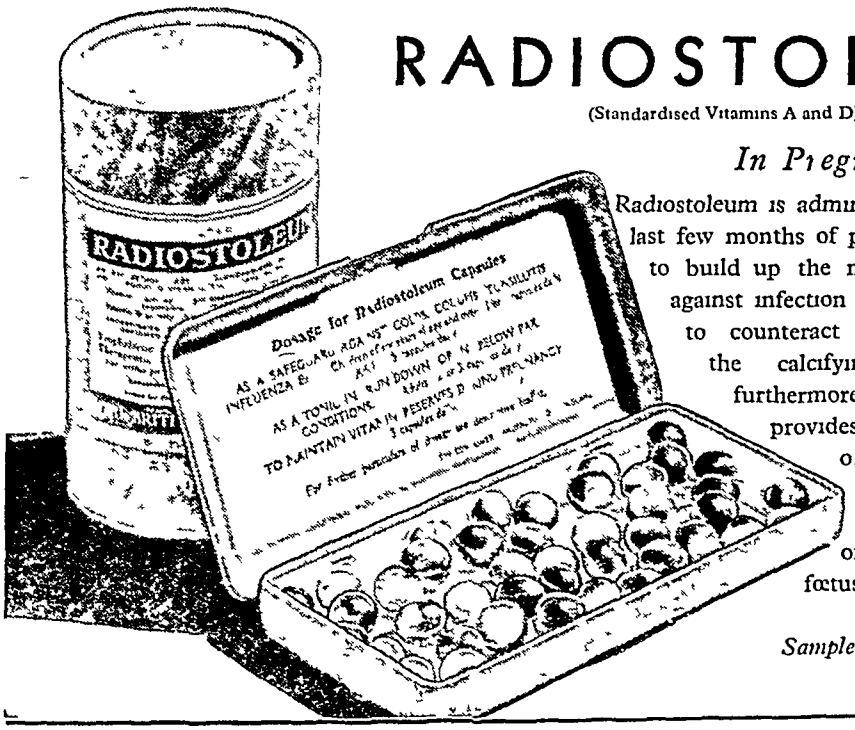
The respective merits of

DETOXICATED and TOXIC VACCINES

The obvious advantage of Detoxicated Vaccines is that large doses can be administered without causing serious reactions This is of great value in the treatment of cases where any given bacterial disease is already established In such cases toxic vaccines are apt only to aggravate the symptoms whereas moderate doses of the appropriate detoxicated vaccine can be given safely without further aggravation of the disease

We have always upheld the superiority of detoxicated vaccines, but some authorities prefer the toxic varieties because they believe that it is important to obtain more or less marked reactions in order to produce a satisfactory immunity



The toxic vaccines have the advantage of cheapness The detoxicated vaccines are more expensive, for the obvious reason that the dosage is nearly one hundred times greater so that much larger quantities of bacteria are used in their preparation

We supply both the detoxicated and the toxic varieties of vaccines in order to cater for the two different schools of thought in this matter A booklet, giving details of our full range of Detoxicated and Ordinary Vaccines, will gladly be supplied on request

FOR SUBNORMAL HÆMOGLOBIN PRODUCTION

Liver Extract with IRON *plus* COPPER

Cofron Elixir (Abbott) supplies Whole Liver Extract, Iron and Copper in definite standardised proportions It is indicated for the treatment of mild anæmias and for use in many non-specific conditions in which there is a decreased red cell count or a lowered hæmoglobin percentage The product is particularly suitable for general use as an iron tonic, or to hasten restoration of normal red cell values following illness that has resulted in anæmia ● Each fluid ounce of Cofron Elixir represents Fresh Liver 40 gms (1¼ oz) Iron 66 mgms (1 gr) (the equivalent of 6 grs of iron and ammonium citrate B P) and Copper 2 66 mgms (1/25 gr) ● The liver extract contains the factor or factors necessary for the maturation of red blood corpuscles and in addition supplies appreciable amounts of vitamins B_1 and B which supplement the patient's daily intake of these factors and thus contribute to improved appetite ● Iron is essential in the synthesis of hæmoglobin while much clinical evidence indicates that copper aids in the full utilisation of iron by the body ● Cofron Elixir is supplied through pharmacies in 12-oz and 80-oz bottles Descriptive literature and a free sample will be sent upon request

COFRON CAPSULES

For Severe Secondary Anæmias

Supply about twice as much liver extract as Cofron Elixir in proportion to their copper and iron content In bottles of 50 and 100 capsules

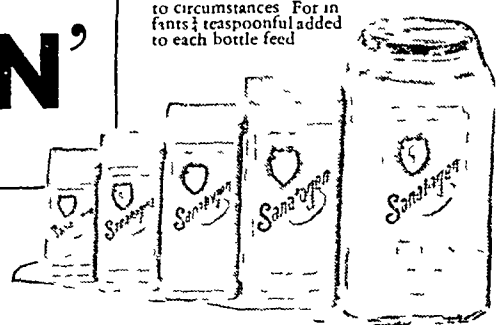
INDICATIONS FOR 'SANATOGEN' No 2

Disease-emaciation

"EVERY medical practitioner knows how difficult it is to nourish a patient suffering from disease-emaciation Do we not all recognise the fact that the starving tissues are fed, not by the food swallowed by the patient, but by the amount of nutrient matter absorbed by the gastric and intestinal mucous membrane? If we could ensure the absorption of nutriment into the blood, the problem of nutrition in disease would be reduced to a matter of mere chemistry and mechanical feeding Judging from clinical results, 'Sanatogen' appears in many cases to possess some power of ready absorbability, without which the richest foodstuff represents simply so much foreign matter in the stomach and intestines My own experience of 'Sanatogen' is that it stays the diarrhœa —ten or twelve motions a day are thereby reduced to one or two, it stops vomiting, and it improves general conditions and causes the patient to put on flesh"

"NUTRITION IN WASTING DISEASES OF CHILDREN AND ADULTS"
(*Medical Press and Circular*)

"THIS condition, which results from imperfect digestive or absorptive power, or which may follow stomatitis, pyloric stenosis, deformity of the tongue or palate, tuberculosis or syphilis, is most frequently associated with improper feeding Fats in such cases are not well tolerated, but the contrary is true with respect to proteids The use of 'Sanatogen', in these cases, proved so satisfactory that we have been encouraged to try it in other cases of infantile atrophy, and have had almost equally pleasing results in a number of patients suffering from this condition It is quite apparent that 'Sanatogen' has considerable power in influencing nutrition"



'INFANTILE ATROPHY"
(*Practitioner*)

"I HAVE before me the records of forty cases fed with 'Sanatogen' They show, what was obvious to myself and the nurses when watching the cases, that these patients wasted less during the acute stage, and picked up more rapidly during the convalescent stage, than patients who did not have 'Sanatogen' This fact, indeed, was soon recognised by the ward sister, without my having in any way drawn her attention to it .. I am firmly convinced that it is a most valuable food for the typhoid patient"

"THE TREATMENT OF TYPHOID FEVER"
(*Medical Times*)

CRUNCHY FOODS AND THE TEETH

Crisp, fibrous foods are generally considered to perform a useful function in scouring the teeth, thus keeping them free from sticky food particles, which are apt to ferment and cause decay. The plentiful saliva, which hard, dry foods produce, is also of value in cleaning the mouth

Furthermore the vigorous mastication that hard foods demand is generally held to assist the growth and correct development of the jaws.

For these reasons many practitioners recommend that the normal diet should include a proportion of hard, dry foods. They find that Ryvita eaten daily has a beneficial effect upon the teeth, especially those of children Free samples of Ryvita for distribution to patients will gladly be supplied on request

Simplify the Technique of Infant Feeding by using

Allenburys Progressive System

ALLENBURYS SYSTEM EMBODIES THE FOLLOWING ADVANCES IN THE SCIENCE OF INFANT FEEDING

(1) **Humanised Casein lactalbumen ratio**
(2) **Intimate incorporation of Dextrin-Maltose**, the benign starch-free mixture of non fermenting carbohydrates
(3) **Homogenised Cream** in reconstituted Milk Foods
(4) **Prophylaxis of Scurvy** Every tin of Allenburys Foods bears and has borne in the past explicit instructions for daily administration of vitamin C
(5) **Prophylaxis of Rickets** Calcium Phosphorus ratio adjusted 560 units of vitamin D per quart reconstituted **Independent biological assay of antirachitic potency**
(6) **Prophylaxis of Anæmia** The reconstituted foods contain 4 parts per million of available iron

Allenburys System provides every known Nutritional Requirement of the Infant
It enables the physician to replace unreliable home-made milk mixtures with readily prepared infant foods which eliminate the risk of enteral infection, and provide easily digested, scientifically balanced meals for babies at every stage in their development

ALLENBURYS Humanised MILK FOOD No 1 (Entirely Free from Starch)

The best first artificial food because it resembles breast milk closely in composition and in the ease with which it is digested

Composition when reconstituted by dilution (1 6) with water as instructed on tins

Fat	Casein	Lactalbumen	Lactose	Dextrin Maltose	Ca as CaO	P as P O	Fe parts per million	Vitamin D per fl oz
3 1%	1%	0 7%	7 3	3 3	0 9	0 16%	4	not less than 14 units

This food is intended for use from birth to 3 months or for longer periods in dyspeptic infants who tolerate it readily

ALLENBURYS Humanised MILK FOOD No 2 (Entirely Free from Starch)

Milk Food No 2 is prepared in exactly the same way as No 1 and retains its general features It is intended for use during the second trimester when digestion is established and it contains a higher proportion of milk protein and correspondingly less carbohydrate The mineral content is adequate in respect of calcium, phosphorus and iron and each fluid ounce of reconstituted food contains not less than 14 international units of vitamin D

ALLENBURYS MALTED FOOD No 3 (The First Step to Weaning)

This food introduces partially converted starch at the seventh month *It has a mineral* and vitamin content equal to No 1 and No 2 and it is intended for use in conjunction with the broader dietary now recommended for the second six months of infancy

Malted Food No 3 prepared for use with cow's milk and water has this composition

Protein	Fat	Carbohydrate	Ca as CaO	P as P O	Fe parts per million	Vitamin D per fl oz.
2.8%	2.2%	9 7%	0 14	0 13%	4	not less than 14 units

ALLEN & HANBURYS LTD LONDON E 2

Formula

Intestinal glands	0·05 grms

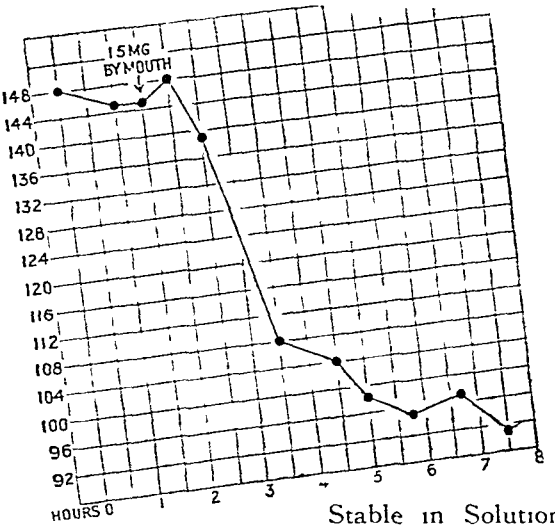
Lactic ferments	0·05 „
Agar-agar	0·05 „
Fiat tablet -	0·35 „

Initial Daily Dose
Two Tablets

Laxatives, it is well known nowadays, must have two essential characteristics

1. They must be biological, i.e., they must accord with and imitate in their action the natural physiological processes of the intestine
2. They must be capable of educating the intestine, so that the habit of a laxative is not formed and the intestine can function unaided when bowel adjustment is attained



Taxol has both these advantages

Taxol has not the violent irritant action of many laxatives and purgatives, but stimulates the intestine by processes which resemble those of nature. The intestinal gland which is an important part of its composition acts on the intestine by reinforcing the deficient function which has culminated in constipation. This stimulating action is gentle, and does not force the weakened intestine to efforts beyond its power, which would culminate in aggravation of the constipation.

Taxol is not habit-forming. It re-educates the intestine to resumption of normal function unaided, thanks to the biological nature of its action. It contains no irritant drug of violent and artificial action to which the intestine can become accustomed. On the contrary, many stubborn cases of constipation, after a course of TAXOL, revert to normal and regular peristalsis.

TREATMENT OF APOPLEXY BY INFILTRATION OF THE STELLATE GANGLION WITH NOVOCAIN

BY

W ARTHUR MACKEY, M B, Ch B, F R F P S, F R C S Ed

Assistant to the Regius Professor of Surgery University of Glasgow Dispensary Surgeon to the Western Infirmary of Glasgow

AND

LAURANCE D W SCOTT, M B, Ch B, F R F P S

Assistant to the Regius Professor of Medicine University of Glasgow Dispensary Physician to the Western Infirmary of Glasgow

A paper by Leriche and Fontaine (1936) suggests the use in cases of apoplexy of a method of treatment which may be dramatic in its immediate effects It consists essentially in the temporary anaesthesia of the stellate ganglion by means of novocain These authors submit that in any case of apoplexy the vascular lesion be it haemorrhage or softening acts as an irritant on the surrounding vessels and produces a halo of irritative vasospasm If this be true then vasospasm by rendering anoxaemic an area of cerebral tissue around the organic lesion may play an important part in determining the scope of the initial symptoms and if persistent may contribute to the ultimate neuronic degeneration Leriche and Fontaine claim that vasospasm can be abolished by interrupting the sympathetic outflow to the head by infiltration of the stellate ganglion with novocain and suggest that such treatment, by sparing neurons that would otherwise perish may in certain cases save life and also aid many patients to make the most complete recovery

Their argument in favour of this treatment is supported by the results obtained in two patients who developed hemiplegia during convalescence following gynaecological operations The first case was that of a woman aged 59 who developed right hemiplegia with coma eight days after the performance of hysterectomy for uterine fibroids She was *in extremis* and 10 c cm of 1 per cent novocain was injected into the region of the left stellate ganglion There was immediate improvement and in fifteen minutes she was so far recovered that she was able to reply to questions with a few words Her improvement was maintained The second case was less dramatic for the patient though aphasic was not comatose Within fifteen minutes of the injection of novocain she could articulate with difficulty The injection was repeated next day and in three days the signs of hemiplegia cleared completely

In view of these results further investigation of the method seemed to be desirable and therefore during the past few months all patients with apoplexy admitted to the wards of Professor J W McNee have been treated by infiltration of the stellate ganglion with novocain

Method

The injection is made into the neighbourhood of the stellate ganglion on the side of the lesion—that is the non paralysed side The ganglion is not easily accessible lying at the inner end of the first intercostal space between the heads of the first and second ribs above and below the body of the first thoracic vertebra medially and the pleura in front It is reached by means of a long needle of the type used for tapping the spinal theca passed in a downward and medial direction under the neck of the first rib The landmark of the neck of each rib is roughly a point 4 cm lateral to the tip of the spinous process of the vertebra above The needle mounted on a syringe is therefore inserted 4 cm lateral to the tip of the spine of the vertebra prominens and driven steadily on until at a depth of about 4 cm it impinges on the transverse process of the first dorsal vertebra which must if necessary be sought and found The needle is then withdrawn slightly and made to pass in a downward and medial direction under the transverse process and the neck of the first rib until its progress is arrested by the body of the first dorsal vertebra This occurs at a depth of 7 to 8 cm and the needle point must now lie in close proximity to the stellate ganglion between the heads of the first and second ribs The needle is withdrawn slightly and gentle suction exercised by means of the syringe If no blood is obtained it is safe to proceed with the novocain injection and 20 to 30 c cm of a 1 per cent solution may be introduced without apprehension The objective is to infiltrate the ganglion and the surrounding tissues if this is achieved Horner's syndrome develops within a few minutes This consists of enophthalmos narrowing of the palpebral fissure contraction of the pupil and absence of sweating on the side of the injection

Rationale of the Method

It has come to be realized in recent years that the results of vascular occlusion do not depend entirely upon the mechanical obstruction to the circulation A whole lung may be removed at operation or the pulmonary pedicle

ligated, with trivial upset of the circulation, while a pulmonary embolism obstructing a much smaller proportion of the pulmonary circulation may result in sudden death When embolism occurs in the main vessel of a limb there is widespread spasm of the collateral vessels, which may be relieved by antispasmodics such as papaverine (de Takats, 1936 , McKechnie and Allen, 1936), passive vascular exercises (Herrmann and Reid, 1934), spinal anaesthesia, sympathetic ganglionectomy, etc The importance of vasospasm in determining the extent of ultimate degeneration has been demonstrated experimentally by Chase (1934) in mesenteric air-embolism Leriche and Stricker (1933) go even further and regard an area of *chronic* arterial occlusion as a source of vasospastic stimuli, treating such cases by excision of the thrombosed portion of the artery, with immediate benefit to the circulation of the limb The therapeutic procedure which we describe is an extension of these principles to the blood vessels of the brain These blood vessels derive a rich sympathetic nerve supply from the plexuses surrounding the internal carotid and vertebral arteries Presumably these nerves are vasomotor, and under stimulation are capable of setting up a condition of cerebral ischaemia The brain however, differs from the tissues of the limbs in its lability, oxygen deprivation is tolerated for only a short time It is to be expected, therefore, in cases of cerebral vascular accident that good results will be obtained from vasodilator therapy only if it be instituted very soon after the onset of the illness The anatomical and physiological facts and the preceding analogies provide *a priori* grounds for expectation of improvement in cases of cerebral vascular occlusion, but the clinical course of our first case seems to justify the hypothesis that even in cerebral haemorrhage there is a considerable amount of vasospasm in the surrounding brain, and that this may be removed by sympathetic anaesthesia

Case Records

Case 1—A man aged 26 suddenly became unconscious on the day of admission On examination presystolic and systolic mitral murmurs were noted The face arm, and leg on the left side were paralysed, he was deeply comatose and could not be roused Two hours after the onset 30 c.cm of 1 per cent novocain was injected into the region of the right stellate ganglion, and within two minutes he regained consciousness, and was able to recognize his relatives and give accurate details of his previous illnesses Horner's syndrome appeared but there was no change in the paralysis The improvement was maintained for some hours when he gradually became stuporous and relapsed to a level of consciousness little above that on admission Another injection of 30 c.cm was given eight hours after the onset and this was followed by a Horner syndrome and improvement similar to that previously noted This improvement was maintained for the next five days but on the sixth day it was evident that he was much weaker physically, although still conscious On the seventh day he again lost consciousness and a further injection of 30 c.cm produced a Horner syndrome but no other changes death occurring within four hours Post mortem examination showed a hypertrophied heart which was the seat of subacute bacterial endocarditis A large haemorrhage measuring six inches in diameter was present in the right cerebral hemisphere, apparently arising from a ruptured mycotic aneurysm A recent embolus was present at the termination of the left internal carotid artery, extending a short distance into the middle cerebral artery

Case 2—On the day of admission the patient, a man aged 48 suddenly became unconscious On examination there was weakness of the face and arm on the right side but no obvious paralysis of the right leg the right plantar response was extensor in type He was unconscious but could be roused with difficulty The heart was not enlarged, and the blood pressure was 110/70 mm Hg Two hours after the onset 30 c.cm of 1 per cent novocain was injected with no immediate change in the clinical condition and Horner's syndrome did not develop Within an hour he regained consciousness and within two hours was able to converse freely On the following day it was noted that there was no longer any paralysis, the right plantar response being indefinite in type Five days from the onset he became stuporous, and the weakness of the right arm returned, 30 c.cm was again injected, with no improvement in the condition despite production of a Horner syndrome Following this he gradually improved, and was dismissed one month later with the right plantar response extensor in type but with no other evidence of neurological damage

Case 3—On the day before admission the patient, a man aged 53, suddenly developed a paralysis of the right arm and leg and at the same time became aphasic There was paralysis of the face, arm, and leg on the right side, and the right plantar response was extensor in type He was deeply unconscious The heart was not enlarged and the blood pressure was 100/70 mm Hg Thirty c.cm of 1 per cent novocain was injected thirty-six hours after the onset, with reproduction of Horner's syndrome but no other immediate change in the clinical condition Twelve hours later he was much less drowsy, but the paralysis was unaltered and the aphasia was pronounced Improvement in this case was slow, and the patient was dismissed six weeks later with paresis of the right leg and a slight degree of aphasia

Case 4—This patient, a man aged 60, was admitted complaining of severe headache and vomiting The heart was enlarged and the arteries thickened and tortuous the blood pressure was 250/150 mm Hg Thirty six hours after admission he suddenly became unconscious The right arm and leg were flaccid and the plantar responses were extensor Thirty c.cm of 1 per cent novocain was injected half an hour after the onset of coma without the slightest change in the clinical condition He died thirty minutes later Post mortem examination showed a greatly hypertrophied heart A large haemorrhage was present in the left internal capsule and lateral ventricle, and a smaller one in the pons There was extensive destruction of the left lenticular and caudate nuclei

Case 5—A man aged 57 had on two previous occasions been under treatment in the Western Infirmary for aortic incompetence, the Wassermann reaction was positive at these times Some hours before admission he suddenly became unconscious There was paralysis of the right arm and leg, the right plantar response was extensor in type The blood pressure was 224/68 mm Hg and systolic and diastolic murmurs were present over the aortic area Four hours after the onset 40 c.cm of 1 per cent novocain was injected Immediately afterwards Horner's syndrome developed and he was able to move the right arm at the elbow slightly and the right leg at the hip quite strongly He regained consciousness to some extent and was able to say a few words with difficulty This improvement was maintained during the next twelve hours, after which time his condition gradually deteriorated and eighteen hours after the onset he was again completely paralysed in the right arm and leg Thirty c.cm was again injected, and following the injection Horner's syndrome developed and there was a return of muscle power to the paralysed limbs He was dismissed five weeks later still aphasic and with a severe residual hemiplegia

Case 6—A woman aged 55 suddenly became unconscious on the day of admission On examination she was deeply comatose and could not be roused, there was a flaccid paralysis of the right arm and leg, with an extensor plantar response on that side The head and eyes were rotated to the left The heart was enlarged to percussion and the blood pressure was 240/130 mm Hg Two hours after the onset 30 c.cm of 1 per cent novocain was injected Horner's syndrome developed and the head and eyes were no longer rotated to the left Two hours later she was much less comatose and made efforts to speak, but aphasia was almost complete She retained this degree of mental improvement to

the day of her death which occurred seven days after admission from hypostatic pneumonia the paralysis remaining unchanged Permission for a post mortem examination was refused

Case 7—On the day he was admitted to hospital a man aged 54 began to have convulsions which lasted until his admission He was deeply comatose and the face arm and leg on the right side were paralysed The heart was not enlarged and the blood pressure was 160/68 mm Hg Four hours after the onset 30 c cm of 1 per cent novocain was injected with no immediate improvement Horner s syndrome did not develop One hour later he regained consciousness and made efforts to speak his vocabulary being defective Eighteen hours later another injection of 20 c cm was given this being followed by the development of Horner s syndrome Immediately thereafter he was able to move his right arm quite strongly and to feed himself One hour later there was some return of muscle power in the right leg This improvement was maintained and he was dismissed four weeks later with some aphasia weakness of the right leg but with full function of the right arm

Case 8—On the day of admission the patient a woman aged 64 suddenly became unconscious On examination she was comatose and could not be roused There was paralysis of the face arm and leg on the left side The plantar responses were extensor The heart was enlarged to percussion and the blood pressure was 225/125 mm Hg Fourteen hours after the onset 30 c cm of 1 per cent novocain was injected with the production of Horner s syndrome Within a few minutes of the injection she began to speak but there was no change in the paralysis This improvement lasted a few hours only and eighteen hours after the injection she was again deeply comatose and the head and eyes were strongly rotated to the right Thirty c cm was again injected with reproduction of a Horner syndrome a similar immediate improvement in the mental condition and disappearance of the deviation of the head and eyes This improvement lasted some eighteen hours when she again became comatose with rotation of the head and eyes to the right A further injection of 20 c cm was made with a slight immediate improvement in the mental condition the production of Horner s syndrome and abolition of the rotation of the head and eyes This lasted only a few hours and she gradually became weaker dying five days after admission Permission for a post mortem examination was refused

Case 9—One hour before admission a man aged 44 suddenly became unconscious On examination there was a flaccid paralysis of the left arm and leg the plantar response being indefinite on that side Twenty c cm of 1 per cent novocain was injected one and a half hours after the onset but Horner s syndrome did not develop No immediate change occurred in the clinical condition but thirty minutes later there was a return of some muscle power in the left arm and he could be roused Following this he improved slightly and one and a half hours later could move the left arm weakly and made efforts to speak Thirty c cm of 1 per cent novocain was again injected three hours after the onset, and with the completion of the injection he became deeply cyanosed and respiration ceased Artificial respiration was commenced and maintained for thirty minutes when he began to breathe naturally Two hours later he was greatly improved and could move the left arm quite strongly there was some movement at the left hip and knee and he was talking freely This improvement was maintained for some hours but thereafter he gradually became weaker and died fourteen hours after admission Post mortem examination showed a hypertrophied left ventricle with vegetations on the mitral valve suggestive of healed bacterial endocarditis Emboli were found in the right internal carotid artery and also in the right sylvian artery A large red softening was present in the area of the left lenticular nucleus there was evidence of old infarction in the island of Reil on the left side and also in the left lateral cerebellar lobe

Case 10—A man aged 67 collapsed on the day of admission On examination the heart was found to be enlarged and there was paralysis of the face arm and leg on the left side The head and eyes were deviated to the right the plantar response was extensor Twenty c cm of 1 per cent novocain was injected into the region of the right stellate ganglion two hours after the onset, the injection being followed by Horner s syndrome No change was noted in the clinical condition Six hours after the onset another injection of 20 c cm was made resulting in the production of Horner s syndrome but with no other effect Following this he became progressively weaker and died suddenly on the sixth day Post mortem examination showed a large haemorrhage present in the right cerebral hemisphere that appeared to have been there for some days Apparently the haemorrhage had ruptured into the lateral ventricle on the sixth day and the ventricular system was filled with blood

Results

Since some cases of apoplexy improve spontaneously during the hours immediately following the catastrophe the results of any form of active treatment must be reviewed critically If however marked improvement occurs *within a few minutes* of the carrying out of a therapeutic procedure there can be less doubt of the existence of a causal connexion For the purposes of the present investigation the injection is regarded as being without effect unless a change was produced in the clinical picture within a few minutes of the injection of novocain

Infiltration of the region of the stellate ganglion was practised on nineteen occasions in nine of these improvement in the clinical condition was produced within a few minutes of the completion of the injection Only in Case 1 was the immediate improvement dramatic and in this patient the result was so remarkable that by comparison subsequent results seemed rather disappointing Life was certainly prolonged and the patient was brought from deep coma to a state of clear consciousness in which had it been necessary he might have made a will On occasion this might be of medico legal importance Death occurred seven days after the onset of the apoplexy from a subsequent massive embolism of the middle cerebral artery on the opposite side

In the other cases in which there was immediate improvement the effects were much less striking Some showed diminution of the depth of unconsciousness and more ready response to questions and physical stimuli Others revealed some return of muscle power in the paralysed limbs In all of these nine successful injections introduction of novocain was followed by the development of a Horner syndrome indicating that the stellate ganglion had been anaesthetized and that the injection had been correctly placed

On ten occasions the injection of novocain produced no immediate improvement, after five of these injections however Horner s syndrome did not develop and presumably therefore the absence of improvement may be attributed to the fact that the sympathetic outflow was not blocked in these cases Some proof of the truth of such an explanation was obtained in Case 7 This patient received two injections of novocain the first was given four hours after the onset of the apoplexy but was apparently incorrectly placed as a Horner syndrome did not develop and no improvement was noted in the clinical condition The second injection given twenty two hours after the onset, produced Horner s syndrome and was followed by immediate return of muscle power in the hitherto paralysed arm

On five occasions there was no immediate improvement after the novocain injection in spite of the production of a Horner syndrome In one of these the injection

was made seven days, and in another five days, after the onset of the apoplexy, when it was most unlikely that benefit would accrue from relaxation of vasospasm Two injections were given in a case of massive cerebral haemorrhage which eventually ruptured into the lateral ventricle and was of such severity that no improvement could reasonably be expected from any form of treatment In the remaining case the failure of the injection to produce improvement cannot be explained at the present time These findings are summarized in the table

Case No	Injection No	Suspected Variety of Apoplexy	Interval since Apoplexy	Immediate Result	Horner's Syndrome
1	1	Cerebral haemorrhage	2 hours	Recovery of consciousness from deep coma	Yes
	2		8	Recovery of consciousness	Yes
	3		7 days	No improvement	Yes
2	1	Cerebral thrombosis	2 hours	"	No
	2		5 days	" "	Yes
3	1		36 hours		Yes
4	1	Cerebral haemorrhage	½ hour		No
5	1	Cerebral thrombosis	4 hours	Return of muscle power to arm and leg slight recovery of consciousness	Yes
	2		18 "	Return of muscle power in arm and leg	Yes
6	1	Cerebral haemorrhage	2 "	Head and eyes no longer rotated to side	Yes
7	1	Cerebral thrombosis	4 "	No improvement	No
	2		22	Return of muscle power to arm	Yes
8	1	Cerebral haemorrhage	14 "	Recovery of consciousness	Yes
	2		32 "	Recovery of consciousness head and eyes no longer rotated to side	Yes
	3		50	Slight recovery of consciousness	Yes
9	1	Cerebral embolism	1½ "	No improvement	No
	2		3 "	Collapse respiratory failure	No
10	1	Cerebral haemorrhage	2 "	No improvement	Yes
	2		8 "	" "	Yes

It is necessary to point out that the procedure described is not always devoid of danger Case 9 received a first injection of 20 c cm of 1 per cent novocain in the region of the right stellate ganglion without noticeable effect A second injection some hours later was followed by immediate respiratory failure, and artificial respiration had to be carried out for thirty minutes before breathing was re-established A possible explanation of this accident is that some of the novocain was injected intravenously, despite the effort always made to ensure that a vein had not been entered A similar case is mentioned by Cyrnx (1937) as occurring at the clinic of Leriche Our patient died twelve hours later and was found to have had a large cerebral softening, yet the suspicion persists that in this instance death may have been accelerated by treatment Furthermore, it is not always possible to differentiate cases of cerebral haemorrhage from cases of cerebral vascular occlusion and it might be supposed that the production of cerebral vasodilatation in the former would carry with it the risk of increased haemorrhage, and so would be dangerous We have been fortunate in encountering no untoward effects suggestive of this complication even in cases which seemed likely to be suffering from cerebral haemorrhage,

Summary and Conclusions

Infiltration of the region of the stellate ganglion was carried out on nineteen occasions in cases of apoplexy, a definite clinical improvement followed nine of these injections Only in one case—the youngest of the series—was the improvement dramatic, and in this instance the immediate beneficial effect of the treatment cannot be doubted In the other cases the degree of improvement was relatively slight In one instance the injection was followed by respiratory failure apparently produced by the solution being accidentally introduced into a vein

The results obtained do not justify the adoption of anaesthesia of the stellate ganglion as a routine method of treatment in apoplexy, but further study is necessary before the method is rejected as of negligible value In the small series of cases studied it was impossible to control such important variables as the age of the patient, the duration of the illness, and the nature of the causal lesion, but it is believed that the following tentative conclusions are justified

1 The use of the method in cases of severe cerebral haemorrhage in patients of middle age and older will serve only to bring it into disrepute

2 Cases of cerebral thrombosis may show some improvement of their clinical condition following anaesthesia of the stellate ganglion, the degree of such improvement will be partly dependent on how much arterial sclerosis is present

3 The ideal case would seem to be one of cerebral embolism, especially in the young

4 It is important that in all cases the treatment should be given as soon after the onset of the apoplexy as possible, and probably only a negligible degree of improvement can be expected if the illness has lasted longer than twenty-four hours before treatment is commenced

Our thanks are due to Professor McNee for permission to treat patients in his wards One of us (L D W S) was in receipt of a grant from the Rankin Medical Research Fund

E Hoffmann (*Amer J Syph Gon* March, 1938) confirms the doctrine of "without a syphilitic mother no syphilitic child" He points out the importance of a search for spirochaetes in women suspected of infection especially in the cervix, and of blood and cerebrospinal fluid Wassermann and Kahn examinations after the fourth month He considers that the germ cells and foetus up to the fourth month are never affected, and points out the value of (1) a note of the placental size (2) search for spirochaetes in blood from the umbilical vein and (3) a ray examination to reveal osteochondritis in infants In treatment he stresses the good tolerance of mother and child to the arsenobenzene group

COMMON FOOT AILMENTS*

BY

W SAYLE CREER, M Ch Orth, F R C S

(From the Orthopaedic Service Salford Royal Hospital)

Abnormalities and deformities of the feet causing pain and disability are so exceedingly common that the difficulty is to choose conditions which can be described and discussed with profit within a reasonable space I am told that the average medical practitioner is ignorant of them because there is no literature in which he can read about them This is not strictly true though one must admit that the textbooks dismiss the subject with very few words and that only the specialist is likely to read the journals or buy the books in which full descriptions are given It is in the hope that help can be given that I have dared to produce this resume

The medical profession is privileged to see the private life of the public to enjoy confidences not given to any other and is at times burdened with the responsibility of making or marring a life The orthopaedic surgeon's responsibility is very often to restore an injured workman to full earning capacity or to relieve the foot troubles of those whose life is to say the least made a burden because of pain

This problem of pain so frequently glossed over or forgotten is a very real one and because there is a widespread belief among the public that surgeons are too fond of the knife there is a great deal of hesitation in seeking aid Too often after assuring the patient that some simple form of non surgical treatment will give relief one hears the sigh. I wish I had known that twenty years ago! For twenty years afraid to seek help! What this aid could have amounted to is revealed by a consideration of some common foot ailments and their treatment without recourse to surgery

No better idea of the prevalence and ratio of some of these conditions can be obtained than by analysing the figures for the orthopaedic clinics of two foot hospitals In these two institutions every patient who requires advice or treatment for conditions that are not simple or straightforward chiropody is referred to the orthopaedic surgeon for advice In two years these cases amounted to 1 000 In the following table the figures in the column Cases refer to the number of times such a condition has been seen As the patient may have more than one condition the number of cases does not correspond to the number of patients In fact the average is 1 35 lesions or conditions per patient

Table Showing Analysis of 1 004 Patients seen from April 1936 to March 1938

	Cases	/	
Metatarsal arch abnormalities (flattening pain etc.)	254	24	Found in 327 or 33% of the patients
Hallux valgus complex (see below for description)	203	20	
Flat foot (acquired only)	194	20	
Hallux rigidus	103	10	
Hammer toe	40	4	
Unusual severe or persistent corns and ingrowing toe nails etc	150	—	

These figures convey some idea of the extraordinary number of patients seeking relief from chiropodists for foot complaints which have always been regarded as orthopaedic conditions There is a reason for this Later in the paper palliative methods of treatment are described and the reasons why they are used are given under the heading Contraindications to Operation as well as in the paragraphs dealing with the methods All the measures described are commonly used by chiropodists to a far greater extent than by surgeons (unless the orthopaedic department is fortunate enough to have a chiropodist attached) so that the nervous patients fearing surgery yet craving relief have gone to those from whom non surgical treatment could be obtained

The Hallux Valgus Complex

By far the most common of the afflictions that beset the feet of the twentieth century Briton is an abnormality of the metatarsal region Excluding the figures for metatarsal arch defects which include all cases in which the metatarsal arch is flattened irrespective of symptomatology the most common ailment is the hallux valgus complex Although much has been written in recent years of the operative treatment of this condition little has been said regarding the many factors of which it is an aggregation and which suggest the name hallux valgus complex

Examination of some 300 cases has shown that the various parts of the foot are affected approximately in the following order of frequency and include the following conditions (Fig 1)

(1) Flattening of the metatarsal arch with spreading of the metatarsals and the formation of

(2) callosities on the plantar aspect

(3) valgus deformity and inward rotation of the hallux

(4) formation of a bunion over an exostosis on the inner side of the first metatarsal

(5) The second toe lies either under or over or is pushed laterally by the hallux If the former it is generally a hammer toe and has a painful corn on the dorsum of the proximal interphalangeal joint

(6) The outer three toes are usually crowded together the fifth tucked under the fourth the fourth under the third and the third under the second In other cases they are clawed and more or less rigid The worse the metatarsal arch reversal—that is the arch reversed from a concavity downwards to a convexity—the more likely will there be clawing of the toes

(7) Dislocation of the second metatarso phalangeal joint is surprisingly common when looked for In my experience not less than 8 per cent are so affected Sometimes the dislocation is of the third metatarso phalangeal joint and I have seen it affecting the fourth while two joints may be concerned

(8) A genuine flattening of the longitudinal arch with both foot and calf symptoms may be found

(9) Corn formation on the dorsum of the fifth toe and at the tips of the second and third toes is frequent

(10) Affections of the nail of the great toe are common Pressure of the second toe on the nail sulcus causes in growing toe nail Interference with the nail bed gives rise to onychogryphosis onychatrophia and the like

(11) Swelling of the foot from oedema not due to general conditions is occasionally met with

Any or all of these conditions may be bilateral or unilateral This picture is not an exaggeration in any way It is not surprising that the patient complains of pain in several sites In fact every single factor of the deformity may give rise to pain or tenderness I say tenderness because so often it is pressure when walking which causes the pain while at rest there is comparative comfort

Possible Modes of Production

One could argue about the cause of all these troubles for years without being able to give conclusive support to any contention A few facts clear the ground a little My figures show that the number of males affected is only one to every fifteen women It is usual to find on inquiry that the males whose feet are really deformed have suffered from a general or local infective disease such as rheumatic fever generalized arthritis gonorrhoea or frost bite Clinical examination shows that metatarsal flattening and spread and callosity formation are more common that slight hallux valgus and a small exostosis

*This paper is an expansion and adaptation of a lecture illustrated by sketches and a cine film given to the Lancashire and Cheshire Branch of the B.M.A. at Salford Royal Hospital on February 23 1938.

come next, and that the whole gamut of deformities is present only in the fully developed condition

There is one other factor to consider, and this in my opinion is the key to the whole problem Women wear "high-heeled" shoes which slope down from the heel to the base of the toes (Fig 2a) This, as can be demonstrated by radiographs, means that the metatarsals are more or less vertical and that the body weight is thrown forward on to the metatarsal arch This throwing or sliding forward at each step causes (1) rubbing of the plantar skin on the sole of the shoe at point × in Fig 2a, and almost certainly accounts for the thickened skin, (2) distorts the transverse or metatarsal arch, (3) crowds the toes into the front of the shoe, (4) dorsiflexes the toes at the metatarso-phalangeal joints and leads to secondary contracture of the long and short extensor

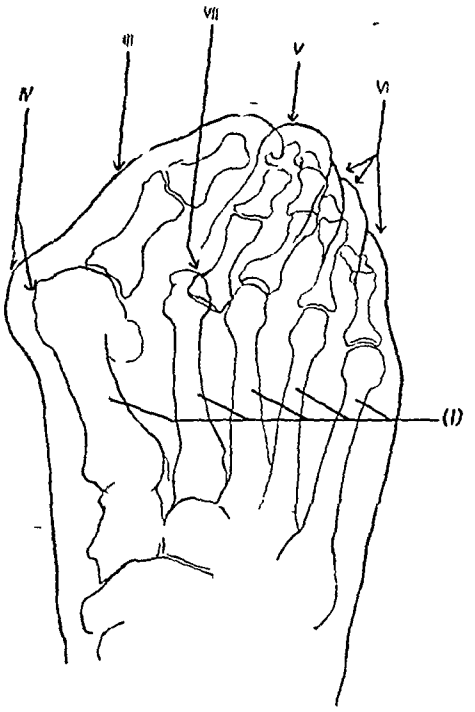

FIG 1—Tracing of a radiograph of hallux valgus complex (see text)

muscles, with stretching of the small foot muscles, the interossei, and lumbricals

If the heel part of the shoe were horizontal instead of sloping (Fig 2b) the sliding might be reduced, though it can never be abolished with heels higher than about one inch Added to the heel height and slope we have the fact that there is insufficient heel and instep grip in most shoes and none at all in court shoes—that is, shoes with no fastening across the instep A strap across the instep is effective only with moderate or low heels With high heels it presses too hard and causes pain The inefficient grip of the mid- and hind-foot necessitates the toes being used in a manner that Nature never intended, in order to prevent the shoe falling off This upsets the normal muscle balance and is the cause of the flexion contractures at the interphalangeal joints—the gripping effect necessary

The effect of sloping and high heels is therefore to change the posture of the foot, to pitch the body weight on to the metatarsal heads and the transverse arch, and to cause spreading of the arch Inevitably the toes are dorsiflexed at the metatarso-phalangeal joints, and in order to grip the shoe become flexed at the interphalangeal joints (Fig 3)

To account for the lateral deviation—the valgus deformity—of the hallux is perfectly simple, though there are two chief schools of thought The first says that short tight hose and/or shoes are the deforming factor This hypothesis takes no notice of heel height It can not be gainsaid that since our maidens start wearing pointed shoes at a very tender age this is a not unreasonable theory It is undoubtedly the explanation for the crowding together and overlapping of the outer toes But I cannot help remembering the cases one sees in males, where pointed shoes have not been worn and where there is the other factor—generalized infection Anyone who has seen a pair of feet swollen and distorted with gonorrhoea or acute rheumatic fever must be struck by the fact that all the tissues are oedematous and softened The effect on the small muscles and the ligaments is only too easy to visualize And we know, too, how these feet become deformed, almost as we watch them, even though the patient is wearing no shoes

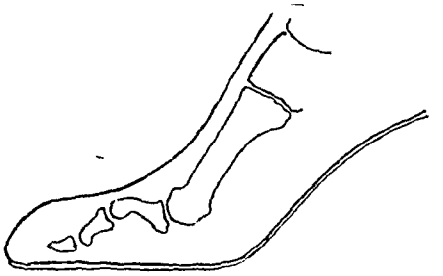

FIG 3—Tracing of a radiograph of a foot in a high heeled shoe showing the vertical position of the metatarsals

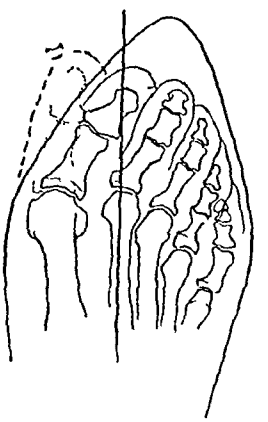

FIG 5—Tracing of a radiograph of a foot in a shoe, showing that pointed shoes prevent the great toe being kept straight and that the point of the shoe is lateral to the mid line of the foot

Whereas before the attack they were reasonably or perfectly shaped, by the time it is over, some very few weeks later, there is spreading of the metatarsal arch, hallux valgus, and clawed toes as severe as one can ever see

By analogy I have been forced to believe that in women the wearing of high heels and the abnormal posture of the feet cause vascular and mechanical disturbances which, by affecting the small muscles and ligaments, allow the metatarsals to spread or "fan out" This spreading separates the attachments of the adductor transversus and the adductor obliquus hallucis The outer attachments are to bone, and are therefore "fixed" The inner attachments are virtually to the base of the phalanx of the great toe, and as the phalanx is connected to the foot by a joint any pull on the bone will move the joint and move the toe into the known valgus position An argument supporting this is that as the muscles are attached to the plantar aspect of the phalanges one would expect them to cause rotation around the long axis of the toe as well as lateral deviation We would expect the rotation to be so that the toe is twisted inwards till the nail looks towards the opposite foot The rotation is found (Fig 4)

Briefly, then, it can be asserted that the hallux valgus complex is caused by (1) an "infective" process affecting the feet, or (2) the wearing of unsuitable shoes The

former cause is less common but is the more frequent one in males

That the valgus deformity is assisted by narrow-pointed shoes cannot be doubted The point of a very large proportion of feminine shoes is outside (lateral to) the centre line of the second metatarsal and toe and it is impossible to fit a foot with a normally positioned great toe into these shoes All these points are easily demonstrated by radiographs Tracings of radiographs are much more easily understood therefore some are presented here instead of the original films (Fig 5)

The explanation of the dislocated metatarso phalangeal joint(s) is easy It is caused by the pull of the tight extensor tendons on toes which are kept dorsiflexed because of the high heels The proof is simple and depends on clinical facts anatomical and operative dissection and experimental stimulation of muscles at operation

Surgical Treatment

The surgical treatment of hallux valgus deformity has been argued and discussed for at least two generations In one group of operations an attempt is made to correct the fanning of the metatarsals as well as to correct the great toe So far as I know these operations have not gained any wide popularity because although they look well on paper their execution is not easy nor is their effect that which might be hoped for

The popular operations take the form of making a false joint for the great toe by excision of (1) the base of the phalanx or (2) the head of the metatarsal I will refer you to some correspondence in the *Journal* (1935 1 446 504) for opinions on the relative merits of these operations After months of facts and figures no side won The truth is that in many cases any reasonable operation will cure the valgus deformity of the hallux but as Sir Robert Jones pointed out many years ago there is small satisfaction for patient or surgeon if the more shapely foot is still painful and he emphasized what most of us know that the foot (as a whole) must be considered as a whole In so many cases the patient complains of pain only at the base of the second toe The enthusiastic surgeon who corrects the deformed great toe and neglects the cause of pain in the second toe has performed a good operation but has not necessarily performed one to cure the complaint which made the patient consult him

If the patient's complaint is referable to the second toe and there is a dislocation here one must either excise the base of the phalanx of the second toe or tenotomize the extensor tendons If the pain is due to compression of the second toe between the first and third toes and there are no other complaints it may be wiser to amputate the toe It has been argued that this will allow the great toe to deform further I doubt it But it does allow the vain lady to go on wearing *pointed* shoes—no small psychological point

The trouble may be the painful corn on the hammer toe There may be corns on other toes These corns may be due to the tight extensor tendons which press the toes up against the shoe In such cases tenotomy of the extensor tendons must be performed or the tendons may be transplanted to the metatarsals in order to aid reformation of the metatarsal arch One can go on almost for ever describing the many things which may need doing and one or more of which will have to be done in many cases but as this is a matter for the surgeon I will not take up any further space here

Contraindications to Operation

What of those who refuse operation or on whom operation cannot be performed? The former are a very large group The medical contraindications to operation are exceedingly few If it were necessary to use a general or spinal anaesthetic one might hesitate to suggest operating on a lady of 70 whose cardiovascular system was poor But if she is suffering constant pain as a result of a foot condition which can be relieved one has to ask oneself whether it is not true that relief of the pain would improve her general condition Seeing that it is perfectly easy to perform almost any operation under local anaesthesia the operative risk itself is negligible I refuse however as a result of experience to transplant tendons under local anaesthesia It is not wise to operate on a case where there has been recent rheumatic fever or gonorrhoea because of the risk of lighting up the inflammation Severe cases of diabetes arteriosclerosis or other vascular disturbances and advanced nephritis or

cardiac disease or varicose veins with oedema of the feet make one pause, because a poor circulation in the foot always implies the risk of sepsis or poor healing of the wound, but each case must be considered on its merits The final contraindication is when the patient refuses to wear reasonable footwear after the operation the corrected foot will not fit pointed shoes, and if the foot is forced into them soon after operation the deformity will recur

A much more important group of patients includes those who cannot afford the time for operation and after-treatment I warn all my patients that they must expect to be away from work for not less than six weeks In some cases nearly three months is required It is not that the patient is laid up for long—most patients can start walking in three weeks—but when we remember that the feet do more work and support more weight than any other part of the body it is not surprising that in the elderly it takes two months to restore them to their original agility and power There is always this consoling fact when deciding whether the time can be afforded that whereas before the treatment the patient was a cripple, afterwards he or she will rediscover the joy of painless movement

Palliative Treatment

But to those for whom operation is an impossibility we can offer palliative measures that are worth while They may involve a little trouble and some attention to details, but those of us who have prescribed them know how grateful the patients are for the *relief of the pain* These measures apply to all foot conditions—not only hallux valgus complex They can be divided into

(1) Alterations to shoes or the prescription of special types
(2) The fitting of protective pads
(3) The application of corrective strapping
(4) Attention to corns, callosities, etc
(5) Physiotherapy—that is, heat in various forms, massage, exercises

The whole of this issue of the *Journal* could be filled on these subjects alone, so I will confine the account to examples of what can be done and the reasons behind the suggested treatment

ALTERATIONS TO SHOES

I have seen a number of cases of hallux valgus complex where the patient's whole life was overshadowed by her foot troubles Shoes were ordered from ordinary shoemakers—not surgical shoemakers We sent a draft or outline of the foot together with measurements taken with an ordinary domestic tape-measure, and asked for modified straight-inner-sided shoes with one-inch heels, plenty of toe room, etc These shoemakers supply good-looking comfortable shoes in a short time and at a reasonable price In some cases my patients, who decided to have these shoes until such a date as they could take time off for the operation, were so relieved by wearing them that the operation never was performed

Simpler measures include the fitting of a rubber "metatarsal dome into the shoe (Fig 6) This is a most useful little support It distributes the weight of the forefoot and the callosities and pain due to localized pressure in this region are greatly relieved An alternative support of great value is made by cutting and shaping 7/16-inch semi-compressed adhesive felt, which adheres to the foot

In the case of hallux rigidus where there is pain because the metatarso phalangeal joint *cannot* be moved or *when* it is moved, the fitting of a metatarsal rocker bar makes it possible to walk without any movement here I have patients whose radiographs showed very marked osteo arthritis, but who have been freed from all pain by this fitting which costs 1s 6d Fig 7 illustrates the principle well

PROTECTIVE PADS

Bunions corns callosities, and all tender areas can often be relieved by the fitting of a well-shaped pad I knew of these measures as a medical student, but it was a chiropodist who taught me the secret of success I used the same material as he did—adhesive felt But whereas I only cut out what I thought was a good shape he carefully makes his pad to shape from a metal template and then skives or bevels it so that it fits without any abrupt edges (Fig 8) Similar kinds of pads can be used for the toes The type illustrated in Fig 9a fitted on to the dorsum of clawed toes and overlying the metatarso phalangeal joints, with a smaller one underneath the toes, will provide an extraordinary degree of comfort The smaller type (Fig 9b) on one toe—for example, hammer-toe—will protect and relieve painful corns It will be obvious that the limit to the use and design of pads is that of the ingenuity and skill of the doctor or chiropodist The important point is to skive or bevel the edges To make and apply them consumes more time and patience than the busy surgeon or doctor may possess And one must express the opinion that here is a case where we might very profitably utilize the skill and time of the chiropodist, who spends his life working with such material

CORRECTIVE STRAPPING

The uses of this method of treatment are somewhat limited, but of value in the young No other treatment is required for deformed toes in early childhood In hallux valgus one can sometimes prevent pressure of the great toe against the second by employing it, but unless the patient has a particularly good pair of shoes the benefit of the strapping is lost

CORNS AND CALLOSITIES

Callosities form most commonly under the heads of the metatarsals in metatarsal arch flattening and in hallux valgus usually under the second, third, and fourth metatarsals, in pes cavus most commonly under the first and fifth They can be exquisitely tender Protection by adhesive strapping or a metatarsal dome alone is of a little value The best treatment is to remove the thickened skin A special form of scalpel—a spade scalpel—which cuts at the end of a broad blade is a very easy instrument to use and is a favourite of the chiropodist After removal some means of preventing rapid return must be devised The metatarsal dome or pad such as that described is one measure A special insole shaped and hollowed is even better, and for this a good surgical shoemaker's aid must be sought Ideally one should order shoes made on a last which has been built up to match a plaster cast of the foot This ensures—provided the surgeon insists on it—that the inner surface of the sole is shaped to the foot the exact opposite of trying to make the foot fit the shoe

There are two common ways of treating corns One is to prescribe a corn paint or plaster These contain for the most part salicylic acid They do help but so often do infection of the corn and inflammation of the foot follow their misuse that I have no hesitation in condemning them Far better to let the chiropodist use his skill in enucleating the corn 'root and all' Corns, like callosities are due to intermittent pressure of the shoes When the shoes are unsuitable permanent cure is ensured by seeing that correctly shaped shoes are obtained

PAIN CORNS AND FLAT FEET

Aside from the discomfort itself, corns, callosities, and other causes of pain play a much more important part in the production of foot disabilities than is commonly realized Most of us have experienced this at some time or other when, on a long walk or march, we developed a painful blister or rubbed toe or simply made a hole in our socks We soon became conscious that besides the pain there was a tired aching feeling in the foot and the calf This ache is the symptom of muscle fatigue Why should muscle fatigue arise because of a pain? Previously we walked with no trace of it

The muscles of the legs have a postural tone or supporting action, which is under reflex control Agonist

and antagonist groups of muscles influence each other and in conjunction with stimuli from skin and joints a perfect balance of power is maintained Sherrington and others have shown how easily this reflex balance could be affected how the tone of one group of muscles could be altered by stimuli of many types and from many sites and organs In particular pain could inhibit the tone If for instance the action of one muscle causes pain from pressure against a nail in the shoe a blister or a corn then the tone of that muscle is reflexly inhibited and its power reduced This upsets the delicate balance and if we persist in trying to walk the muscles protest by aching and tiring While there is no agreement as to whether the human foot should or should not possess an arch or whether the muscles of the leg are the principal supports of the arch common experience teaches us that the first symptoms of flat foot are tiredness of the legs and aching in the calf Furthermore treatment directed to the relief and cure of muscle strain relieves the condition For this reason one believes that the muscles are of supreme importance

In the treatment of mobile flat feet and of muscle fatigue in the legs it is manifestly important first to make sure that there is no painful corn present So often there is such a cause After treating this, or if there is no such painful element in the case the following measures are needed First the overstrained muscles must be relaxed and rested by providing a mechanical support Wedge the inner side of the heel The heel must be low enough and wide enough to allow of it If high heels are worn the stability of the whole foot is impaired and the condition made worse Depending on the width of the heel the wedge should be from three sixteenths to one third of an inch The inner side of the heel should be elongated by about three quarters of an inch to provide extra support under the astragalus and scaphoid (Fig 10) In very severe cases rest in bed for a few days may be required To restore the tone and power of the muscles massage exercise and electrical stimulation must be ordered After a few treatments the patient may be permitted to continue to exercise at home without supervision

PHYSIOTHERAPY

It is not possible to say very much here on this subject but it must be mentioned Radiant heat or infra red rays relieve pain help to loosen rigid joints and assist recovery after operation Massage influences the circulation and increases the blood supply so improving local metabolism and aiding in the removal of fluids The mechanical effect of massage and wrenchings also removes fluid breaks down adhesions and restores mobility Exercises restore mobility to joints and increase the tone and power of muscles

In minor foot conditions there is unlimited scope for the use of all these measures but I will not enter into details now except to say that many of us are apt to neglect them in the after-treatment of feet which have been operated on There is not the slightest doubt in my mind that they are almost essential in the elderly and in those cases where no operation is performed they play a most important part

Shoes

The correspondence columns of the *Journal* have shown how little agreement there is on the question of what constitutes a good shoe I hold definite views on the subject That they are of value can be demonstrated to any who care to examine and question the patients for whom I have ordered what I consider correct footwear It is very simple (1) the shoe must grip the heel firmly (2) there must be a bar or other tie which fits over and grips the instep (3) the fore part (vamp) must conform to and be a little more anatomically correct than the foot and must allow enough room for the toes to move about (4) the heels of the shoes worn out of doors or at work or play (and in the case of indoor occupation those worn during the day) must not be higher than one to one and a half inches So simple yet so difficult to obtain though in the last three years or so there has been a marked improvement in the models made by good shoe manufacturers

A Problem

There are two theoretical objections to the palliative measures I have described The first is that they are palliative only But as we have seen they frequently do restore the patient to comfort The other is that so much of them is tedious to carry out and requires regular repetition We have the trained masseur or masseuse to give physiotherapy but in the past there has been no one to see to the paddings strappings corn cuttings etc It may be for this reason that they have been neglected The specialist cannot expect his private patients to pay his fees for regular visits He has no time in a busy orthopaedic clinic The general practitioner is far too busy and in any case has no wish to acquire a reputation as a corn-cutter

There are specialists in this branch of auxiliary medical work—the chiropodists The public discovered them many years ago and are going to them in ever increasing numbers for such treatment as I have mentioned There were 45 000 attendances at two of Manchester's foot hospitals last year Very few medical men and fewer hospitals have felt it wise to enlist their aid We at Salford Royal Hospital have had the benefit of a chiropodist's help for over a year and we appreciate to the full just what he can do I would like to make a plea for some definite liaison between properly trained and approved chiropodists and the medical profession There is so much that they can do They are doing it in their own private practices and clinics One wonders whether we are not missing an opportunity to render even better service to our patients by failing to utilize their skill in our hospitals and our own private practices

Since the above was written a report has appeared from University College Hospital advocating the appointment of a chiropodist to all diabetic clinics They state that since they appointed a chiropodist the incidence of gangrene among diabetics has fallen by 50 per cent One wonders whether there is not a medico legal aspect to be considered The hospital which does not appoint a chiropodist may be guilty of negligence in not providing expert treatment to the best of its ability as laid down by several High Court judges

---

G C Higoumenakis (*Ann Derm Syph* Paris December 1937) points out that in 1927 he recorded the case of a patient with congenital syphilis who had a swelling on the inner third of the right clavicle and he showed at the same time a radiograph of the clavicles of another patient suffering from these two conditions After investigating a large number of unselected dermatological cases and reviewing the literature on the subject the author has become convinced that this sign is as important as any in the diagnosis of congenital syphilis and that its frequency is as great as that of the better known stigmata of the disease It does not occur in those who are healthy or in persons suffering from acquired syphilis He stresses the selection by the spirochaete of connective and lymphatic tissues the presence of a secondary centre of ossification at the inner end of the clavicle and the membranous origin of the clavicle He considers that another factor in the production of this swelling is the repeated irritation of the sternal end of the clavicle at the sterno-clavicular joint as it is the clavicle which prevents the acromion from sliding towards the mid line when the arm is being used Although the condition most commonly affects the inner third of the right clavicle he has thirteen cases of people who are left handed or who use the left hand a great deal who have developed a swelling of the inner end of the left clavicle X ray examination and the pathological finding indicate that the condition is essentially a formation of new bone and not a periostitis

TETANUS BACILLUS RECOVERED FROM THE SCAR TEN YEARS AFTER AN ATTACK OF POST-OPERATIVE TETANUS

BY

VICTOR BONNEY, M S , B Sc , F R C S , F R A C S.
CHARLES BOX, M D., F R C P , F R C.S

AND

JOHN MacLENNAN, M B , Ch.B.

(From the Departments of Obstetrics and Gynaecology and of Pathology of the British Postgraduate Medical School Hammersmith Hospital London)

In 1928 a young unmarried woman aged 31 was admitted into the Royal Masonic Hospital under one of us (V B) with a large mass of uterine fibroids reaching to the umbilicus He performed myomectomy, enucleating fifty-three tumours from the uterus and then reconstructing it The suture material used was composed of strands of catgut and very fine silk interwoven Fifteen days after the operation the patient complained of not being able to open her mouth, difficulty in swallowing, rheumatic pains, and stiffness of the posterior cervical muscles, and in a short time all the typical features of tetanus presented themselves

She was placed under the care of C B , who carried out intensive serum treatment Cistern puncture was performed three times, 20,000 units of anti-tetanic serum being injected on each occasion, and, in addition, the patient was given a total of 26 000 units by two intrathecal injections and a total of 9,000 units by two intramuscular injections Morphine, heroin, chloral, and bromide of potassium were also administered As the result of this treatment and after a period of great anxiety, the spasms diminished and she eventually completely recovered The abdominal wound healed by first intention, and the condition of the uterus did not appear at any time to be unsatisfactory The discharge from the uterus and the unused remainder of the suture material employed at the operation were examined for *Cl tetani*, but it was not found, and therefore the diagnosis of tetanus rested on the clinical picture, which was unmistakable

Early in 1938 the patient, now aged 41 and still unmarried, came to see V B because for the last year she had noticed her abdomen enlarging He found a large mass of new fibroids and advised subtotal hysterectomy The possibility that the spores of *Cl tetani* might still exist in the uterus or the abdominal scar occurred to him, and he communicated with C B on the matter The latter strongly advised a prophylactic dose of anti-tetanic serum after the patient had been protected against anaphylaxis by desensitizing her

She was admitted to Hammersmith Hospital, where, after the precautions mentioned had been carried out, V B opened the abdomen through the old scar and performed subtotal hysterectomy, at the termination of which he excised with scissors, in two strips, the whole thickness of the abdominal scar tissue After the operation two further prophylactic injections of anti tetanic serum were given The patient made an uninterrupted recovery except for a certain amount of joint and muscle pain, which was judged to be the result of the serum

Bacteriological Findings

The specimen submitted to the bacteriologist (J MacL) consisted of a portion of the uterine wall and two strips of scar tissue, including the skin and the whole thickness of the abdominal wall

These were finely minced up by means of sterile scissors, inoculated into a series of tubes of cooked meat medium and of glucose blood broth, and incubated anaerobically for forty eight hours at 37° C At the end of this period there was some slight growth of a coccus in one tube only, but after a further two days incubation all six cultures made from the operation scar gave considerable growth of typical slender bacilli with round terminal spores in one of the tubes these were apparently in pure culture, in four there was in addition *Staph albus* and in one *Staph albus* and *Cl sporogenes* The cocci were destroyed by heat and the drumstick bacilli readily isolated by the method of Fildes (*1925*) Apart from some scanty growth of *Staph albus* in two of the tubes the cultures made from the uterine wall remained sterile after one month s anaerobic incubation, and were then discarded

The six cultures obtained from the scar tissues were examined and compared in considerable detail, and were found to be quite indistinguishable It was assumed, therefore, that one strain alone was involved This was in all respects a perfectly typical tetanus bacillus In view of this it would be unnecessary to detail the morphological and cultural investigations Toxigenicity was tested for in a series of mice Intramuscular inoculation of 0 25 c cm of a twenty-four-hour broth culture produced spasm and death in from twenty-four to forty-eight hours , previous injection of a similar amount of anti tetanic serum invariably gave complete protection

By agglutination tests with sera prepared against the nine types of *Cl tetani* the organism proved to belong to Tulloch s Type III , incidentally it was one of the comparatively uncommon Type III strains which do not agglutinate spontaneously in saline suspension Apart from the Type VI strains (which are non-motile) this differentiation of *Cl tetani* into various serological groups depends very largely if not entirely, on the flagellar antigens The heat stable 'O" agglutinins of *Cl tetani* have recently been studied by Gunnison (1937) Heated suspensions of our strain were tested out against 'O antisera of the nine types The results are in complete agreement with those obtained by Gunnison with her Type III strains —that is, it possessed the "O' antigen common to all nine types, but not the additional heat-stable component found in toxigenic strains of Types II, IV, V, and IX To sum up after presumably ten years in the spore form this strain of *Cl tetani* showed no difference from other representative strains in its morphology, cultural characters, toxigenicity or antigenic composition

In view of the long time that the organism had remained in the tissues it was thought of interest to investigate whether any antibody response had been evoked in the patient Unfortunately she had received several hundred units of anti-tetanic serum before the bacilli had been identified so that any investigations from that standpoint were impossible However, it has been suggested that in tetanus an actual anti bacterial immunity may be developed, and in support of this Ten Broeck and Bauer (1923) and Condrea (1937) have demonstrated naturally occurring agglutinins in man and certain animals The patient s serum was tested for the presence of 'H and O" agglutinins against the original strain and against

representatives of all nine serological types with completely negative results In addition her serum was tested against a suspension of the original strain which had been allowed to spore very freely but no reaction could be detected either by agglutination or by complement fixation technique

Discussion

Comparatively early in the study of the bacteriology of tetanus it was realized that the spores of the bacillus had very great powers of resistance Thus von Eiselsberg (1888) reported that a splinter of wood which had caused tetanus in a boy was capable of infecting rabbits two years later and Henrijean (1891) recorded similar results after an interval of eleven years As regards survival within the animal body opinion was much more guarded It is true that Vaillard and Rouget (1892) Tarozzi (1906) and others had shown experimentally that spores might lie dormant in the tissues for several months yet this was generally looked upon as quite exceptional and it was not until the war and after that a number of cases of tetanus were recorded in which the primary infection had occurred months or even years previously

The longest latent period about which there can be little doubt is in the case reported by Ernst (1931) in which tetanus developed fourteen years after the original war injury but intervals of seven years (Brunzel 1929) and four and a half years (Kaposi 1917) are also on record None of these cases however are comparable with our case for in all of them the symptoms of tetanus developed first and then a possible source of previous infection was sought For instance in Ernst's case a wad had remained embedded in the tissues of the hand for fourteen years but without any symptoms The patient then accidentally crushed his hand but without breaking the skin and developed tetanus the spores of the organism presumably having lain dormant in the wad

In post-operative catgut tetanus examination of the remainder of the ligature material used and of the discharge from the operation area has often failed to show *Cl tetani* and it has been suggested that the condition is not true tetanus but in the case we now publish the findings show that it certainly was They also show how important it is even after the lapse of many years to take anti tetanic precautions when operating on a patient who has previously had tetanus

We are indebted to Sir Frederick Menzies Chief Medical Officer London County Council for permission to publish the record of the case from Hammersmith Hospital

THE RISING INCIDENCE OF PSYCHOSOMATIC ILLNESS

BY

JAMES L HALLIDAY, M D, D P H

Regional Medical Officer Department of Health for Scotland

The increase in incapacitating sickness its maintenance at a high level and the growth of chronic invalidism among insured persons have puzzled many commentators both lay and medical Recent inquiries by the Regional Medical Staff of the Department of Health for Scotland have shown that the mass of chronic incapacity in that country may be regarded as "genuine" (McKinlay 1937) In a previous study (1935) of the incidence of psychoneurotic illness I wrote It is interesting to speculate how far the rise in the rate of incapacity among insured persons during the last ten years has been due to an increased prevalence of psychoneurotic disability The present paper—an analysis of morbidity statistics—shows that in the light of modern knowledge the only possible interpretation of the maintenance of the present high sickness rates is an increase in psychoneurotic and psychosomatic illness

Note on the Term Psychosomatic Illness —The words psychoneurotic illness suggest *inter alia* the absence of structural change Recent researches however have shown that emotional reaction may bring about changes not only in function but also in structure (Dunbar 1933) A more appropriate term for disorders of this nature—whether (to use medical jargon) they are "cases of functional disease" or cases of organic disease"—is psychosomatic illness This term is cumbrous but useful It connotes both an aetiology and a mechanism As regards aetiology it indicates that the external agents which provoked the reaction of illness were of a special kind being neither physical nor chemical nor micro organic but psychological—as for example the loss of a beloved object As regards mechanism it indicates that the external agent is encountered by the individual not directly by the outer or inner surfaces of the body such as the skin or mucous membranes but indirectly via the special senses and the integrating mechanism of the diencephalon autonomic nervous system and endocrine glands This triad is sometimes called the psycho-neuro endocrine system or the bodily mechanism of emotion By its means psychological factors may affect an individual profoundly bringing about changes in chemistry rhythm secretion and even structure in one or more parts of the body In other words bodily disturbances may be the secondaries of preceding disturbances in the integrating psycho neuro-endocrine system which in turn was set into a turmoil when the individual encountered events which to him represented deprivation frustration upset strain or difficulty

Knowledge of Psychosomatic Disorders of Statistical Relevance

1 THE LABELS

The presence of psychosomatic illness in a community is not revealed directly in its morbidity statistics but lies concealed under a number of labels which with the exception of such terms as neurasthenia nervous debility and neurosis have a reference to localized or mechanistic faults only A knowledge of the considerable latent content of psychoneurotic and psychosomatic illness in certain common diagnostic labels" has now become available as a result of recent researches Some of these which are relevant are indicated below but the reader is referred to the original papers for an adequate presentation of the problem

(a) *Gastritis Rheumatism Anaemia Debility Heart Disease* —Of 735 unselected insured patients suffering from psychoneurotic illness (mainly anxiety states) the certificated cause of incapacity in approximately one half (1170) was one or other of those labels The proportion of psychoneurotic illness for each label was as follows gastritis 70 per cent

rheumatism, 40 per cent, anæmia, 40 per cent debility, 60 per cent, heart disease, 14 per cent (Halliday, 1935)

(*b*) *Peptic Ulcer*.—Of 205 unselected patients with peptic ulcer (both gastric and duodenal), in 84 per cent the symptoms of ulcer first emerged at a time of emotional reaction in response to psychological factors associated chiefly with occupation finance and family health The mechanism involved was considered to be the psycho-neuro endocrine system The authors concluded that the crux of treatment was to free the patient from his anxiety, and if this could be achieved they believed that the patient's dyspepsia would trouble him no more (Davies and Wilson 1937)

(*c*) *Chronic Rheumatism*.—Among insured persons the various terms which indicate "non arthritic rheumatism" frequently cover anxiety states or hysteria with or without the presence of 'rheumatoid' swellings of joints (Halliday, 1937, *1938*) The need for considering psychological factors for an understanding of aetiology and as a guide to scientific treatment of clinically defined rheumatoid arthritis and osteo arthritis has been demonstrated by American observers, such as Jelliffe and White (1935, 1936), Nissen (1936), and Booth (*1937*)

(*d*) *Chronic Bronchitis*.—"It is little known to practitioners that there exist purely psychogenic forms of bronchitis" (Stekel, *1923*) This author summarizes many examples No systematic investigation of the relation of psychological factors to the primary onset and recurrences of chronic bronchitis appears to have been made Among insured persons I have noted that male patients with chronic bronchitis who are enmeshed in a 'pension situation" for this disability are often better understood when regarded as examples of anxiety hysteria with secretory neurosis of the bronchi I have also noted that persons may work for years in a dusty atmosphere but only become ill with bronchitis on encountering psychological factors and reacting with emotion This also applies to many persons whose occupation in no way involves fumes, gas or dust Another interesting point is the not uncommon alternation of bronchitis and rheumatism in the same patient—that is to say, when the bronchitis is troublesome the rheumatism is quiescent, when the rheumatism is troublesome the bronchitis is quiescent A similar alternation of peptic ulcer and rheumatism is not uncommon A number of authors—for example, McDowall (1934)—have noted how patients with chronic bronchitis may be cured by psychotherapy, and in my own limited therapeutic experience I have seen some interesting improvements after the patient has 'coughed it up' or 'got it off his chest" The application of the psychological approach to chronic bronchitis is a virgin field for research There is evidence however, that recurring or chronic bronchitis is sometimes a localized manifestation of psychosomatic disorder, but in what proportion of the patients thus labelled we do not yet know

This section is not intended in any way to suggest that "every person with rheumatism, bronchitis, gastritis, etc, is a case of psychoneurosis" Its purpose is to indicate that a proportion of patients whose illness is certified to be "caused" by certain common labels of disease are suffering from disorders which are psychosomatic in origin and nature This applies not only to labels which are often used in a vague sense—for example, anæmia—but also to labels correctly applied—peptic ulcer, bronchitis, fibrositis, etc

2 THE AGE INCIDENCE

Statistics of age and sex incidence are few and incomplete, but all available evidence points to the age incidence of primary onset of the symptoms being highest in the younger age groups or in early middle life The following examples may be quoted

In my inquiry of 1935 the incidence of psychoneurotic disability among the patients examined was the same for each sex As regards age, the incidence (for the combined sexes) was highest in the youngest age groups Thus the incidence in the age groups 16–34 was 33 per cent, in the age group 35–54 42 per cent but in the age group 55–65 it was only 14 per cent

Bruce Pearson (1938) in an analysis of 950 unselected outpatients at a general hospital found that the incidence of psychoneurotic illness among the patients examined was highest in females As regards age (for the sexes combined) the incidence in the age group under 29 was 22 per cent in the age group 30–49 19 per cent and in the age group over 50 only 5·5 per cent

In their series of 205 patients with peptic ulcer Davies and Wilson (1937) found that the age distribution of onset for the sexes combined was as follows under 35 years, 60 per cent, 35–55 years, 33 per cent over 55 years, 7 per cent

In a series (unpublished) of 134 consecutive referred insured persons certified to be incapacitated because of terms indicative of rheumatism, the age incidence of psychosomatic rheumatism in the age group under 35 was 45·8 per cent in the age group under 55, 41·8 per cent, and in the age group over 55 only 14·3 per cent

In a series of 450 patients with rheumatoid arthritis Glover (1928) compiled a table which shows that for males the age distribution of onset is highest in the group 30–40 years, and for the females in the group 20–30 years

It is perhaps of interest to note that these age distributions are comparable to those found for the onset of asthma in adults (Bray 1934) and for nystagmus in miners (M R C *Report, 1922*)

3 DURATION IN RELATION TO RECOGNITION AND TREATMENT

If the need for supplementing the ordinary examination of the teaching schools with an investigation into psychological factors is not understood, the range of clinical observations is too narrow and adequate remedial measures appropriate to each individual cannot be taken In such circumstances the doctor has regard only for the "secondaries," and treatment is confined to standardized mechanistic and local interference However, in so far as this action ignores primary causes it may be ineffective in preventing recurrence and in cutting short incapacity Further, because of the features of innocence and increased suggestibility which are present in all patients with psychosomatic disorder, routine continuation of mechanistic treatment may succeed in fixing the symptoms for life (Examples of such procedures are perennial alkaline powders for peptic ulcer, course upon course of physiotherapy for rheumatism, or successive nasal operations for bronchitis) The risk of fixation is increased whenever treatment becomes very intensive, very elaborate, or very impersonal, and to-day, when ever growing facilities are available for mechanistic diagnosis and therapy, there is a danger, if relevant considerations are omitted, of inducing "fixation invalidism" on a scale hitherto unknown

The Indices of an Upward Trend in Psychosomatic Illness

From the information surveyed in the previous section it would be reasonable to infer an upward trend in psychosomatic illness (relative to illness with aetiology dependent on other environmental factors) if, over a period of years, morbidity statistics showed changes in three respects, namely

1 An increase in the average duration of "incapacities"

Note.—Increasing facilities for intensive mechanistic treatment provide only one of the many factors which may contribute to the prolongation of sickness

2 An increase in the certificated causes known to cover *psychosomatic illness*

3 These increases would be most marked in the younger age groups

The Application to Morbidity Statistics

Note.—Statistics of morbidity are not common In Scotland, since 1930 the Department of Health has issued Annual Reports on Incapacitating Sickness in the Insured Population These statistics deal mainly with the incapacitating illnesses which begin and end within each annual period under review A valuable survey of these statistics was recently made by McKinlay (*1937*), who, from the standpoint of a statistician, sums them up as follows

> The major problems, from the point of numbers seem to be at least six (1) droplet infections (including influenza), (2) accidents and sepsis of the skin (3) rheumatism especially in its chronic forms (4) gastric upsets of various kinds (5) chronic respiratory diseases (bronchitis), and (6) those ill defined states of ill health

which constitute the bulk of cases labelled debility neurasthenia D A H and tachycardia and perhaps in less degree anaemia

He adds that the divergence of these illnesses from those found in statistics of mortality is very striking

1 INCREASING AVERAGE DURATION OF INCAPACITY

The most significant feature of sickness among insured persons has been its rise over the past twenty years For example in England and Wales the rate of sickness during the years 1921 to 1926 rose by nearly 50 per cent and that of disablement by nearly 80 per cent These have since continued at a high level Turning to the more detailed data available for Scotland since 1930 we find (Report No 6 1937) that, although there has been no definite increase in the *incidence* of 'incapacities (only 2 3 per cent), there has been a very definite increase in their *average duration* (about 11 per cent) Moreover during these years the number of 'chronic patients (that is those who were on the sick list continuously throughout the annual period) increased by one third Indeed of the nineteen million days of incapacity in 1935–6 more than half (eleven million days) is attributable to a sickness of a year or more duration

2 THE RISE MOST MARKED IN CERTIFICATED CAUSES WHICH COVER PSYCHOSOMATIC REACTION

The table illustrates the growth of chronic incapacitating sickness between the annual periods 1931–2 and 1935–6 In Column A are shown the principal certificated causes of chronic illness arranged in order of relative increase Those specified account for 86 per cent of the patients on the chronic register By placing a tick opposite the terms which cover psychosomatic illness we find nine of the fourteen certificated causes specified in Column A to be our old friends

Table showing Chronic Incapacity in Scotland (1931–2 to 1935–6)

A	B				C	D
Certificated Cause	Percentage Increase (1931–2 to 1935–6) of Patients at Various Age Groups				Register (1936) Percentage Constitution	Order of Absolute Rise (1931–6)
	All Ages	16–34	35–54	55–65		
Peptic ulcer	130–140	126	168	92	1 9	7
Gastritis	110–120	121	189	65	1 9	8
Nervous debility	90–100	154	96	58	2.0	9
Bronchitis	70–80	166	136	31	7 9	4
Anaemia		90	79	59	1.3	12
Rheumatism	50–60	85	90	31	12.6	1
Cardiac debility		95	112	54	1 4	13
Diseases of the circulation		78	88	35	11 4	2
Other diseases of the respiratory system		76	78	35	3 9	6
Neurasthenia	30–40	74	46	12	3 5	10
Injuries		51	37	28	3 4	11
Insanity	20–30	60	31	1	21 2	3
Tuberculosis		42	18	2	11 2	5
Cerebral haemorrhage		84	61	5	2 4	14
					86 0	

Note—In 1930 certain details about insured persons in Scotland who became ill and unfit for work began to be collected and analysed (See Reports on Incapacitating Sickness in the Insured Population of Scotland 1931–7) A special register was devoted to those persons who had been on the sick list continuously for more than twelve months. The table is compiled from this Chronic Register and is adapted from data provided in Report No 6, pages 39 to 52 Column A shows the fourteen certificated causes of incapacity which provided the greatest increase in the number of patients between 1931 and 1936 Column B shows the percentage rise in respect of each cause at various age groups Column C shows the percentage constitution of the Chronic Register in 1936 and indicates that those fourteen causes provided 86 per cent of the total register Column D indicates the order of absolute increase in the number of persons allotted to each of the certificated causes for example against rheumatism which provided the highest increase—namely 1 500 persons—is placed the number 1 whereas against cerebral haemorrhage which provided an increase of only 170 persons is placed the number 14

3 THE RISE IN THE YOUNGER AGE GROUPS

Column B shows the percentage increase in the certificated causes at various age groups The highest rate of increase for all ages is shown by peptic ulcer and gastritis Next in order of rate of increase are nervous debility bronchitis anaemia rheumatism and cardiac debility If we underline the age group which shows the maximum rise in each certificated cause we find in age group 16–34 the highest rise was in respect of nervous debility bronchitis anaemia, and neurasthenia whereas for age group 35–54 the highest rise was in respect of peptic ulcer gastritis rheumatism cardiac debility and diseases of the circulation In no instance was the percentage increase greatest in the oldest age group The finding that the increase in such illnesses as rheumatism and bronchitis is *not* in the older age group will surprise only those who have not appreciated the influence of psychological factors as a cause of illness

Note— Chronic illness is still relatively more frequent in the old than in the young and the tendency towards an increasing proportion of older people in the population would tend other things being equal towards an increase in chronic sickness but within the ages under consideration this factor offers at best only a small part of the explanation (McKinlay 1937)

The table contains many other points of interest For example one fifth of all chronic illness is due to insanity and the rise in this during the last five years is most marked in the youngest age group Again rheumatism (see Column D) shows the greatest absolute increase in the number of patients Also the rise of cerebral haemorrhage in the younger age groups is an interesting phenomenon

Findings from the Analysis

On analysis of chronic sickness returns during recent years we find the three indices which in combination reveal an upward trend in psychosomatic illness—namely (1) increasing duration of incapacity (2) increase in the labels known to cover a significant proportion of psychosomatic illness and (3) the younger age groups most affected It is therefore reasonable to conclude that psychosomatic illness is becoming more prevalent and that the maintenance of the high rates of morbidity at present existing in the community can only so be understood No other interpretation covers all the known facts

Note—It is misleading and even erroneous to regard illnesses of this nature as "nervous diseases It is more appropriate to describe them when we are thinking or speaking in terms of mechanism as diseases of the psycho neuro endocrine system" Certain writers however would describe them as illnesses of the spirit or sicknesses of the soul In any case to state that nervous diseases are increasing misses the whole point of the phenomenon

Discussion

(*a*) A high level of incapacitating sickness dependent on psychoneurotic and psychosomatic disorders is not incompatible with concomitant happenings such as a falling death rate increasing height and weight of school children and the abeyance of major epidemics These occurrences—the usually accepted indices of improvement in the public health—have been achieved by action directed mainly towards the noxious physical chemical and micro organic factors of environment Psychosomatic illness on the other hand may be regarded as a response to noxious psychological factors of environment The potency and practical implications of these however have hitherto received little systematic attention in so far as they affect the health of the community as a whole and as a result psychosomatic illness progresses

without check and even with unwitting encouragement A discussion of the "causes" of a high incidence of psychosomatic illness does not, however, enter into the scope of this paper, the aim of which is to point out the phenomenon and to indicate that it is a matter which concerns all medical men

(*b*) A few remarks may be devoted to the problem of preventing incapacity once this type of reaction has occurred To avoid confusion, it may be said at once that only a minority of these patients require specialist psychotherapeutic treatment The great majority can be handled, as they are to-day, by the practitioner—but with a difference The first requirement is the recognition that there is a problem The second is an alteration in thought—an appreciation that illness is a reaction to environment in all its aspects, including the psychological In other words, curative medicine can no longer be contented as at present with the academic question, "What has the patient got?"—because the answers to this question—no matter how accurate and detailed—may in isolation be irrelevant as a proper guide to scientific and effective action A guidance which is often more valid and pertinent may be obtained by posing the natural questions of biology—for example, 'Why did he take ill when he did?", "What is he behaving like this for?" To know what a patient has *met*, or feels he *may meet*, is often of more practical value than to know what a patient has *got* The third requirement is an alteration in action—namely, the inclusion in practice of what may be called the modern supplement to medical examination, especially when the patient first consults the doctor In the absence of this, much incapacity preventable at the beginning becomes prolonged and permanent I have noted that practitioners who examine their patients in this more adequate way do not tend to produce invalids in their practice, whereas those who are unaware of it, or who neglect it, tend to induce or even create incapacity This observation, which refers to civilian practice, may be collated with the observations of others which refer to service practice during the great war For example, "At all times the most important single influence determining the ratio of war neurosis was that of the regimental medical officer" (Mapother, 1936) And again, "Correct handling of patients in the early stage is likely to make all the difference between rapid recovery and chronic invalidism The first link in the chain is the unit medical officer He alone has the power to supply relevant information concerning the causes of breakdown in each case He should have sufficient psychological knowledge to make an early diagnosis" (Burton, 1936)

(*c*) Certain of my medical friends have suggested that if this interpretation of the facts be true, it is a grave reflection on the medical profession Actually, however, there is no reflection, and morals are not concerned Neither is there any criticism Historical observation has shown that the slow percolation of a new scientific outlook is a natural and predictable happening Instead of studying the data and the inferences made from them with attention and clear-headed thinking, people respond with emotion, the reactions being characterized on the one hand by intense enthusiasm and on the other hand by indifference (the 'blind spot") or even open resentment When we react emotionally we exhibit the feature of increased suggestibility Thus, if we become emotionally excited about any theory, our perception and judgment become distorted—we see what we want to see and infer what we want to infer On the other hand if we resent the introduction of a new technique into medicine (as our grandfathers resented the bacteriological and some doctors of to-day resent the psychological), our emotional state prevents us from seeing what we do not want to see and inferring what we do not want to infer

'The influence of emotion on reasoning is considerable when the question is one affecting either the interests of an individual or some theory deeply rooted in his prejudices Darwin recounts that one of his geological friends tried to assure him, against all evidence, that a certain fossil was not found in a given locality, for otherwise his argument (the geologist's) on the geology of the neighbourhood would be wrong, *four of his volumes would go for nothing* This incident made a great impression on Darwin's mind It showed him that the pursuit of truth demanded qualities of courage and will, not less than those of the intellect" (Quoted from Lynch, 1912)

However, the reluctance of the profession to adopt a psychological outlook cannot be dissociated from the growth of unorthodox cults which continue to flourish and impress in fields where orthodox medicine often fails Moreover, within the medical profession itself, lack of instruction in how to think about illness in an adequate way is responsible for many "good men going wrong" when, discouraged by their failure to get permanent results by standardized mechanistic methods, they begin to adopt freakish methods of treatment which have no real scientific foundation It is true that they may obtain "results," but to the detached observer their successes are very obviously a function of their personality on the one hand or of the magical aspects of their treatment on the other

(*d*) Lastly, it is interesting to speculate whether, *ceteris paribus*, a still further extension of mechanistic forms of treatment provided to all comers in the absence of a "threshold" examination which includes the modern supplement will result in a still further increase in the *duration* of invalidism Time and the yard stick of morbidity statistics will show As McKinlay neatly puts it "The efficiency of a service must ultimately be judged by the standard of health of the people rather than by the nature and amount of the facilities available for its preservation"

Conclusions

1 An analysis of Scottish morbidity statistics in the light of modern knowledge reveals a rising incidence of psychoneurotic and psychosomatic illness

2 The extent and significance of this phenomenon are not yet generally realized, but it has definite bearings on the public health as well as on the future of medicine—in outlook, training, research, treatment, and prevention

For assistance in the presentation of this study I am indebted to my colleague Dr P L McKinlay, Medical Statistician to the Department of Health for Scotland

SEASONAL INCIDENCE OF RHEUMATIC FEVER IN THIS COUNTRY

BY

ARNOLD B ROWLANDS, M B , Ch B

The study of the seasonal fluctuations of infectious diseases in this country reveals the existence of two characteristic types

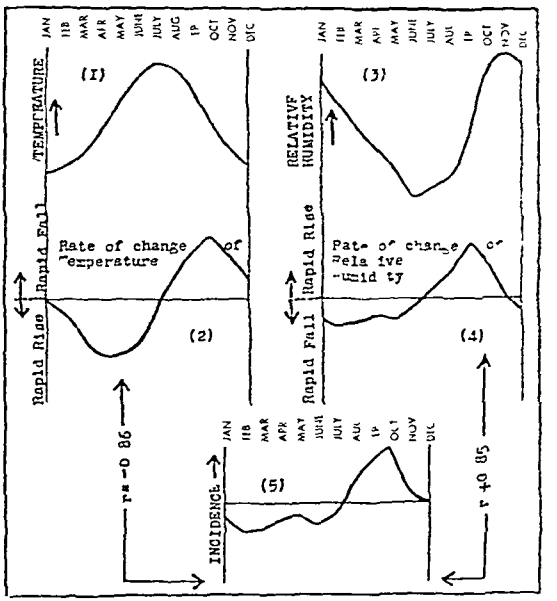
1 *The Solstice Type*—This type dominated by the prevailing temperature includes certain respiratory and alimentary infections which we associate respectively with the winter and summer solstices

2 *The Equinox Type*—Measles and whooping cough usually show a conspicuous increase at the vernal equinox while the autumnal equinox is associated with an increase of throat infections diphtheria scarlet fever and rheumatic fever

Though this classification has severe limitations it has the merit of simplicity Further—and this is the reason for its presence here—it emphasizes a contrast between the conditions prevailing at the two equinoxes It is much easier to appreciate the nature of this contrast than to state directly what is the characteristic feature of the autumnal equinox First in respect to negative evidence there is no significant difference between the temperature and the relative humidity at the two equinoxes What, then is the nature of this contrast?

Dynamic Change

The answer to this little riddle is to be found in dynamics rather than statics The seasonal variation of temperature is determined by the obliquity of the ecliptic which effects a periodic variation of the angle of elevation of the sun's rays At any one place this angle is of course equal at both equinoxes However during the weeks in immediate relation to the equinoxes the angle is changing very quickly Thus the angle increases rapidly in the spring and decreases in like manner in the autumn It is this rapidity of change in opposite directions which supplies the fundamental difference between the equinoxes We have not only a contrast but a significant reciprocal relationship between the two periods of the year when climatic accelerations and decelerations are at their height



The Rate of Change of Temperature

Graphs 1 and 2 illustrate our point Graph 1 portrays the average seasonal variation of temperature at Greenwich Graph 2 deduced from the former represents the rate of change of temperature and shows clearly the contrast between the equinoxes Despite many secondary climatic factors the changes of temperature are still dominated by the theoretical solar climate The most important deviation from our standpoint is the lag in the earth's response to changes in the sun's elevation Thus the most rapid changes of temperature are post equinoctial phenomena

Rate of Change of Relative Humidity

We are aware of an approximate inverse relation between the changes of temperature and relative humidity in this country (Graphs 1 and 3) We can therefore anticipate a close inverse association between their respective accelerations (see Graphs 2 and 4) Let us summarize

Graphs showing the Seasonal Incidence of Rheumatic Fever and its Association with Climatic Factors

GRAPHS 1–5 —Seasonal Incidence of Rheumatic Fever

Graphs 1 and 3 illustrate respectively the seasonal variations of temperature and relative humidity at Greenwich

Graphs 2 and 4 deduced from Graphs 1 and 3 show the rates of change of temperature and relative humidity at Greenwich Graphs 2 and 4 are merely an expression of the steepness of the more familiar Graphs 1 and 3

Graph 5 illustrates the seasonal incidence of rheumatic fever in London

these views in the simplest possible form relevant to our subject We may say that in London September and October are characterized by a deceleration of temperature and an acceleration of relative humidity

Seasonal Incidence of Rheumatic Fever

Graph 5 is based on the onset of symptoms in nearly 1 500 first attacks of rheumatic fever (St Bartholomew's Hospital 1882–1904) This graph shows a striking resemblance to the preceding graphs (2 and 4) Study of these graphs suggests a promise of close correlations This promise is realized

Rate of change of Temperature } and { Seasonal variation of Rheumatic Fever } $r = -0.86$

Rate of change of Relative Humidity } and { Seasonal variation of Rheumatic Fever } $r = -0.85$

(In the text I have refrained from including the mathematical probable error as this may lead to a false idea of accuracy The rate of change of temperature for each month has been derived graphically from the rate of change between individual months This leads to an error in draughtsmanship Thus the total error is probably in the neighbourhood of ± 10 per cent)

There can be no doubt that in this country there is a significant correlation between the seasonal variations of rheumatic fever and the rates of change of temperature and relative humidity Is there any causal relationship between these climatic accelerations and the onset of rheumatic fever?

Climate and Rheumatic Fever

In this country there are two well-established associations between climate and the incidence of rheumatic fever

1 Sir Arthur Newsholme (1935) has clearly demonstrated that the incidence of rheumatic fever is highest in *hot dry* years

2 *Damp cold* has been implicated by numerous workers (Poynton and Schlesinger, 1937)

At first glance these associations appear to be mutually antagonistic Fortunately this paradox is apparent rather than real It will be appreciated that the maximum seasonal incidence of rheumatic fever does not occur in the hottest and driest months, neither does it occur in the damp cold of winter It is to be found between the two, when the hot dry conditions of summer are changing most rapidly to the damp cold of winter

If we regard hot dry and cold damp conditions as two extremes, then the rate of change between the two will be accentuated by an increase of one or both of these factors It would therefore appear that, while hot dry conditions predispose to the onset of rheumatic fever, it is the rate of change to damp cold which acts as the precipitating climatic factor

Conclusion

In view of the presence of significant correlations and a happy reconciliation with current ideas on climate, I submit that one of the factors controlling the seasonal incidence of rheumatic fever in this country is the reciprocal acceleration of temperature and relative humidity

I wish to express my indebtedness to Professor P C Cloake of Birmingham, without whose inspiration and kindly encouragement this investigation would not have been undertaken

At the annual general meeting of the Society for Relief of Widows and Orphans of Medical Men, with Mr V Warren Low, president, in the chair, the report for 1937 and the financial statement were presented and adopted During 1937 sixty-one widows and seven orphans were in receipt of grants and the total amount distributed was £4,702 Owing to the increase of the number of widows in receipt of grants there were not sufficient funds available to make them the usual Christmas present, but each orphan received a present of £5 The receipts for the year amounted to £5 390, including £367 18s 11d from subscriptions and donations The total membership of the society is 285 which is a very small proportion of the medical men eligible for membership Relief is only granted to necessitous widows and orphans of deceased members Membership is open to any registered medical man who at the time of his election is residing within a twenty mile radius of Charing Cross Each widow receives a grant of between £60 and £75 per annum, and the orphans £50 per annum Any widow with an income of £125 or under is eligible to receive a grant The directors are anxious to bring the great advantages of membership of the society to the notice of medical men The invested capital which amounts to over £140 000, may not be used as income, only the interest is available for this purpose This year the society celebrates the one hundred and fiftieth anniversary of its foundation Full particulars may be obtained from the secretary at the office of the society, 11, Chandos Street, Cavendish Square, W 1

Clinical Memoranda

Treatment of Schizophrenia

Since Sakel (1935) introduced his method for the treatment of schizophrenia by the induction of hypoglycaemic 'shocks' a wave of optimism has spread among psychiatrists of almost every country in the world, and insulin therapy in its different sphere is rivalling in popularity the malarial treatment of general paralysis

The Vienna technique has been practised at the Hatton Mental Hospital since June, 1937, and fifty nine cases of schizophrenia have completed a course of treatment comprising fifty or more shocks, unless cure was established with a smaller number In order to get the results of treatment in their proper perspective we have inquired closely into the results obtained in cases of schizophrenia during the years 1931 to 1935 inclusive, with TAB vaccine with somnifaine prolonged narcosis, and finally with no special treatment beyond ordinary nursing care and the psychotherapy of friendly interest We have collected the after-histories of these schizophrenics up to the present, but here we are only concerned with the results achieved during their first year after admission

Table showing Immediate Results in Treatment of Schizophrenia

	No of Cases	Cases Discharged		Average Stay in Hospital	Average Age	Relapses in One Year	Final %
		No	%				
Symptoms 0-¼ year							
Treatment—				Mths	Years

TAB	17	6	35 3	15 0	25 8	1	29 4
None	4	3	75 0	4 0	25 0	1	50 0
Second Attacks							
Treatment—							
Insulin	9	4	44 4	3 5	25 1	0	44 4
TAB	16	7	43 7	7 3	24 7	3	25 0
Somnifaine	6	4	66 7	7.2	23 0	2	33 3
None	32	15	46 9	5 7	25 5	7	25 0

* Excluding one case in hospital for 4½ years If this case is included the average stay in hospital becomes 13 1 months Of all cases in this table the immediate discharges are for insulin 66 % for TAB vaccine 65 % for no treatment 65 and for somnifaine narcosis 58 3%

Although the series is small it has the advantage that almost every patient was well known to one of us (D N P) and the diagnostic criteria are therefore essentially the same in each group The effects observed are summarized in the table

It will be seen that the superiority of insulin is only slight when the percentage of discharges is considered and careful study of these cases has convinced us that this is a genuine comparison James (1938) has pointed out the great reduction in the period of residence in hospital and this is the chief advantage of insulin for the period in hospital is roughly halved and clinically it is striking to see the rapid improvement which often takes place and which is apt to generate an exaggerated idea of the value of this form of therapy In every group of insulin results in the table the hospital period is short and as a general rule it can be stated that if treatment is going to be successful this will soon be apparent

With T A B vaccine as it has been used here no patient's life has been in danger but one insulin patient died and several have had close calls This is an important feature when one is deciding whether the results of insulin therapy justify the difficulties it incurs The results of T A B treatment would appear from the table to be worse than those obtained without special treatment but this is largely explained by the frequent use of T A B when progress was delayed and we believe that this treatment was in most cases a mere incident of no great importance

SUMMARY

Our conclusions about insulin therapy at present are

1 The period in hospital is roughly halved

2 There is a slight superiority in the percentage of cures when compared with other methods

3 These advantages justify its continued use

Massive Hydronephrosis and Pregnancy

The following case is considered worth reporting because of its rarity

CASE HISTORY

A primipara aged 23 was seen on September 17 1937 as an abnormal case at Dulwich L C C Hospital on account of the great discrepancy between the apparent size of the uterus and the duration of amenorrhoea Her last menstrual period began on March 17 1937 and twenty six weeks later the abdominal swelling had extended up to the diaphragm and rendered the abdominal wall tense Otherwise the case was obstetrically normal The pelvis was commodious the Wassermann reaction was negative and there were no signs of toxaemia The patient had felt foetal movements for six weeks only No foetal parts could be felt and the foetal heart was not heard

A radiograph was taken and the report read One foetus of about twenty eight weeks lying in the right iliac fossa the head being uppermost presumably a case of hydramnios

The patient was admitted for paracentesis abdominis in the hope that the presence of urea in the fluid would confirm the radiological diagnosis and exclude the alternative one of ovarian cyst Urea was present but in a concentration of 0 75 per cent which could not be regarded as indicative of hydramnios for it is about double the concentration of urea in normal liquor amnii Moreover the abdominal mass presented a firmer consistency in the right iliac fossa than elsewhere The patient was in excellent health and anxious to have a child The distension was so enormous that premature labour was considered inevitable As the diagnosis of hydramnios was doubtful the decision was made with full explanation to the patient to explore the abdomen We were almost certain that the case was not one of hydramnios but at the same time could not understand why a cyst should contain so high a concentration of urea The true diagnosis never occurred to us

OPERATION

The abdomen was opened under general anæsthesia on September 30 1937 A tense cyst was found reaching from the diaphragm down to the pelvic floor The uterus was identified in the right iliac fossa with the cyst overlying it above and in front The intact tumour was quite unmanageable so it was tapped and twenty five pints of clear greenish fluid withdrawn The cyst wall then lay in folds upon fold in the abdomen like a collapsed balloon Careful examination of these folds showed that the transverse and descending parts of the colon were closely applied to that portion of the cyst wall which had occupied the right side of the abdomen It was then realized that the cyst was a colossal left hydronephrosis Peritoneum to the left of the colon was stripped up and the whole wall separated by blunt dissection in the space corresponding with the perinephral tissue This led to isolation of the renal pedicle the vessels of which were small They and the ureter were ligated and divided separately and the cyst wall removed No cause of the hydronephrosis could be seen in the region of the renal pedicle The right kidney was felt to be larger than normal

An enormous dead space occupying the left side of the abdomen and pelvis was covered with peritoneum as well as possible and the colon replaced A large drainage tube was placed down to this area The uterus now occupied its normal position and corresponded in size to cyesis of twenty eight weeks The emptying and removal of the cyst caused considerable collapse of the patient but she began to recover as soon as the abdomen was closed

During the following week 2 units of proluton were given daily and 5 minims of adrenaline eight hourly with a view to preventing premature labour

The only complications which took place were a stitch abscess at the top of the wound pus from which grew *Staphylococcus aureus* and a severe *B coli* infection of the remaining kidney The wound was well healed in three weeks but the urinary infection remained till delivery in spite of every variety of medical treatment

DELIVERY

Labour started with rupture of the membranes on December 29 1937 thirteen weeks after operation Except for a first stage lasting thirty two and a half hours the confinement was normal The second stage lasted two hours and fifty minutes A live male child weighing 6 lb 9 oz was delivered without rupture of the perineum. The puerperium was normal and on the fourteenth day the urine was sterile Mother and child left hospital in good condition on the eighteenth day after delivery the baby then weighing 7 lb 12 oz.

The case was remarkable for the size of the tumour which possibly represents a record for hydronephrosis for the quiescence of the uterus after an operation of the first magnitude and for the courage of the mother The only comparable case we have found in the literature is that of Dr Heinz Kustner of Leipzig[1] Here the cyst weighed 20 German pounds (17½ pints) and was removed intact Miscarriage at five months took place the next day

Treatment of Plantar Warts

There is no doubt that during recent years plantar warts have become much commoner There is a consensus of opinion on this point among those concerned in their treatment, whether general practitioners, dermatologists, or chiropodists During the recent discussion on the subject in these columns, little attention appears to have been paid to the pathology of these troublesome little tumours As regards this it has been established beyond all doubt that they are infective in origin, which accounts for the fact that they are very often multiple, but they are extremely superficial in nature, never penetrating deeper than the epidermis Sometimes a large one may be as much as a quarter of an inch thick, but even then it always lies as it were in a cup, of which the base is the dermis while the sides are formed by the epidermis with a greatly thickened horny layer The thickening of the horny layer is no doubt a compensatory reaction in order to take the pressure from the wart itself, which is usually extremely sensitive, and transfer it to a healthy skin This thickened collar is exactly analogous to the corn plasters, with a hole cut in the middle, commonly used for the relief of corns The leading principle in the treatment of plantar warts is to effect a separation of the base of the wart from the underlying dermis In the case of small warts this may often be done by the employment of some keratolytic agent, salicylic acid, which softens the horny layer, being the best On the heel and the ball of the foot the horny layer is very thick, and after treatment for some days with a salicylic ointment or plaster it will often peel off in an almost unbroken sheet, carrying away with it small warts—for example, those which are not of greater diameter than two or three millimetres, but in the case of the larger specimens, which may be as much as a centimetre in diameter, macerating treatment alone is ineffective For them some form of surgery is usually required, but excision by means of a scalpel, followed by the insertion of sutures, should never be practised It is unnecessary, and often leads to the formation of a painful scar

SURGICAL TECHNIQUE

People sometimes talk about the "roots" of warts, but there are really no such things Even the largest of them, if extracted entire, will be found to have a smooth pearly white basal surface which lies in a capsule formed by the surrounding skin As a rule it is not very difficult to find the line of demarcation between the wart and its capsule and to curette it out with the aid of a sharp spoon Whether this little operation should be done under local or general anaesthesia depends very much upon whether the patient is a child or an adult Usually, general anaesthesia is best for children and a local anaesthetic for adults The base of the wart is often tightly attached to the dermis, so that there is a chance that the line of demarcation may be missed and the adherent dermis be removed with it, thus making a wound right through to the subcutaneous tissue such as is likely to lead to the formation of a painful scar It is desirable, therefore, before curettage to adopt some means of loosening the wart in its bed There are two good methods of doing this first, by the administration of a dose of x rays, secondly, by the application of a pencil of carbon dioxide snow If available, the administration of x rays is to be preferred It is, indeed, quite possible to kill plantar warts and cause their disappearance by the use of x rays alone but for this purpose a very heavy dose is required in the case of large and thick warts, and there is some degree of uncertainty as to exactly how much is necessary in each case As a measure preliminary to curetting a dose equivalent to two Sabouraud pastilles may be safely given, provided of course that the surrounding skin is carefully screened This dose is at all events sufficient to cause a certain amount of shrinkage of the wart, and after a few days it is much easier to curette, as it is no longer so tightly adherent to its bed The administration of x rays has also the advantage that it at once diminishes tenderness on pressure, which is usually the chief symptom complained of by the patient The application of the carbon dioxide pencil is also useful because it causes a certain amount of effusion between the wart and its bed thus facilitating removal, but it has the disadvantage that it is painful in itself and has no analgesic effect subsequently Many cases, probably amounting to some hundreds in all, have been treated on these lines with unfailing success I do not remember ever to have seen a recurrence

Keratitis from Working with Creosote

These two cases are of clinical interest from an ophthalmological point of view and also useful as drawing attention to the danger to employees of working with creosote Both cases arose in gardeners who were creosoting a fence in different localities Neither of them was conscious of a splash of creosote getting into the eye but rather thought fumes got into their eyes, and they suffered later from irritation and consulted their own doctors after work In reality small droplets must have gained access to the eyes

CASE I

H H aged 67, was creosoting a fence on January 28, 1938 He thought some fumes of creosote got into his left eye He had uneasiness and blinking but no great pain He was treated by his doctor till February 10, when he came to me saying the sight of the left eye was blurred On examination there were three small grey maculae below the pupil, but also numerous small grey spots on the cornea and a hazy superficial keratitis a condition due, I thought, to numerous small droplets of creosote impinging on the cornea The condition under treatment has settled down but there will be permanent impairment of vision

CASE II

A G, aged 49, consulted me on May 13 with a history of creosote fumes getting into his left eye about two months previously, since when his vision has been hazy He did not have much pain, but he went to his doctor, who treated him But the haziness remained On examination on each side of the pupil there was a small grey macular patch where two bigger globules of creosote must have landed, but there were also numerous small grey specks and a superficial hazy keratitis where minute droplets of creosote must have settled The condition had apparently settled down but left hazy vision

In both cases the history was the same Both patients complained of irritation of eyes after working with creosote, neither complained of great pain, such as one would expect in such damage to the cornea, and the clinical appearances were the same—both were gardeners In both the impairment of vision will be permanent

Creosoting of posts and fences is a common occupation both for amateur gardeners and their employees, and the publication of these two cases may lead to general practitioners giving a warning to any of their patients who work in gardens

Reviews

THE BRITISH RED CROSS

The Story of the British Red Cross By S H Best Foreword by The Hon Sir Arthur Stanley G B E (Pp 275 11 illustrations including a frontispiece 8s 6d net) London Toronto Melbourne and Sydney Cassell and Company 1938

The British Red Cross is a subject on which not a great deal has been written and indeed its discontinuous history—for it is only in war that it becomes really significant—is not easy to relate Mr S H Best in *The Story of the British Red Cross* which has appeared opportunely during the 16th International Red Cross Conference tells a plain unvarnished tale and Sir Arthur Stanley who contributes a foreword is equally matter-of-fact but even these sober details of organization pulse now and then with adventure It is strange that no Red Cross organization was built up in this country following the Crimean War for Florence Nightingale embodied if anybody ever did the Red Cross spirit It was the Franco Prussian War of 1870 which led to the foundation of the National Society for the Aid of the Sick and Wounded in War which was the precursor of the British Red Cross Society An organization was swiftly improvised and British Red Cross surgeons were operating amidst the bullets at Sedan But it was not until 1897 just before the Boer War that the organization of Red Cross work in this country took a decisive step forward when representatives of the National Aid Society the St John Ambulance Association and the Army Nursing Reserve met in conference with a view to finding out how best they could co operate with the Army Medical Service and with one another As a result the permanent Central Red Cross Committee came into existence and almost immediately had its baptism of fire on the South African battlefields Later it was felt that the principle of unification might be extended and the present British Red Cross Society came into existence in 1905 with Queen Alexandra as its president— essentially a woman's work said the Queen in her inaugural speech But when the European War broke out the Society was still a small organization occupying two rooms in Victoria Street and living on a negligible income Its expansion was on a similar scale to that of the British Army itself To take the financial measure alone by the end of the war it had raised £24 000 000

Nearly half the present book is taken up with the story of the Society in the war of 1914–18 This again is not easy to relate for Red Cross work had no well defined limits merging sometimes almost imperceptibly into the work of the Royal Army Medical Corps At first much confusion was caused by the fact that the Army Council in which the control of the Red Cross emblem is vested had granted authority for its use to the Ambulance Association of the Order of St John so that there were two bodies engaged in the same work sending personnel and material to the armies at the front The situation was remedied by the formation of a Joint War Committee consisting of representatives of both bodies In the early days of the war the Red Cross offered an obvious channel for patriotic and compassionate service To Sir Frederick Treves it fell to interview the doctors who wished to serve and 400 were engaged at £1 a day with quarters and rations Many of them served in France some in Serbia and elsewhere Some were in units of which the Society had sent out thirteen and the joint organization a further six before the end of 1914 Vivid memories of those days are recalled by these chapters—the establishment of the auxiliary hospitals the organization of the V A D s (who were a matter of jest at first, but earned the tribute from Sir Arthur Sloggett D G M S that they were one of the greatest factors of the medical organization of the war) and the purchase of the Star and Garter Home The Red Cross emblem was the brightest thing that many a war-weary eye saw in four years Here is a typical example of service which perhaps would not be accounted much of an achievement to day but twenty years ago made a shining record

> A telegram was received at Boulogne headquarters requesting a supply of pituitary extract urgently needed by a casualty clearing station A supply of this extract was received at noon on the following day and was immediately dispatched by motor cyclist who delivered it at the casualty clearing station the same evening

But that is only one of scores of quotable instances A bare dozen pages are allotted to the post war activities of the Red Cross but these include such work as the blood transfusion service the clinic for rheumatism in London and the training of personnel for the A R P

ACTIONS AND USES OF DRUGS

The Essentials of Materia Medica Pharmacology and Therapeutics By R H Micks M D F R C P I Second edition (Pp 378 12s 6d) London J and A Churchill 1938

The appearance of a second edition of Professor Micks's textbook confirms the opinion we expressed when the first edition appeared three years ago that it was of exceptional merit and would prove popular The outstanding feature is the clearness with which the author states the really important actions and uses of drugs At the same time he has little respect for age in relation to therapeutic traditions and when he believes a drug to be useless states this opinion without superfluous qualifications This simple method of approach results in a textbook which is both interesting and easy to read

The material has been thoroughly revised An account is given of the numerous important new drugs that have appeared during the last three years A separate chapter is devoted to prontosil and sulphonamide and it is interesting to note that as much space (seven pages) is given to these drugs as to the treatment of cough Emetics on the other hand are dealt with in a single page while volatile oils occupy four pages which end with the remark that the presence in pharmacopoeias of most of these substances is a relic of the past rather than a testimony to their therapeutic importance These examples suffice to show the striking difference between the textbook under review and those which follow more classical traditions Professor Micks's treatment of the subject is of course the one which really accords with up-to-date clinical practice It would indeed seem that though pharmacology is one of the youngest of the medical sciences yet it already has acquired classical traditions which are tending to lag behind current practice Professor Micks's textbook undoubtedly helps to ward off this threatened senescence since its very omissions emphasize the fact that most of the points around which controversy centred during the nineteenth century are to day of minor importance

We congratulate the author on the care he has taken, not merely to incorporate an account of *new drugs* in the new edition but to rewrite whole chapters so that the relative importance of new and of old methods is shown in true perspective

AN AMERICAN HANDBOOK ON EYE DISEASE

A Textbook of Ophthalmology By Sanford R Gifford M A M D, F A C S (Pp 496 249 figures, 10 coloured plates coloured frontispiece 18s net) Philadelphia and London W B Saunders Company 1938

Dr Sanford R Gifford, professor of ophthalmology in the North-Western University Medical School, Chicago, has written a handbook on the diseases of the eye for the use of medical students and general practitioners The book follows the usual lines of such works There is a good account of the examination of the superficies of the eye, then of ophthalmology and the functional reactions of the eye There follow chapters on refractive errors, the diseases of the several parts of the eyes, and a chapter on the eye in general disease There is an appendix giving the appraisal of loss of visual efficiency according to the standard method approved by the House of Delegates of the American Medical Association in 1925 The text is well and clearly written, it is a safe guide to the student and to the general practitioner The type and paper are good, but the illustrations of which there are many, are disappointing Dr Gifford has used photography far too much There are many fundus pictures done by photography which are clever in themselves but which in our opinion are quite useless as an aid to the student Such pictures in their lack of distinction are in sharp contrast to the several colour prints prepared from drawings made by the artists of Theodore Hamblin of London There are few photographs of eye conditions which can equal the careful limning of the intelligent artist

PERIPHERAL EMBOLECTOMY

Les Embolies Artérielles des Membres By H Haimovici Preface by R Leriche and J Fiolle (Pp 336 55 fr) Paris Masson et Cie 1937

In this welcome monograph Dr Haimovici reviews the whole subject of the occlusion of the limb arteries Based on the personal experiences of the author as well as a bibliography of several hundred references, which is by no means the least valuable part of the book, the field covered includes sections on history, aetiology, symptomatology, diagnosis, prognosis, pathology, and treatment It is introduced by a short preface by Professors René Leriche and J Fiolle, who, in drawing attention to its importance, state that hitherto the subject has been dealt with in only a random way, and that this is the first contribution to analyse the subject and deal with it as a whole The pathological aspect, however is given most prominence, and the whole of the twenty-four illustrations, with the exception of the first few which are concerned with experimental work, are photomicrographs from sites of vascular occlusion and depict emboli or the vessels containing them This is our chief criticism of this excellent monograph, we should have welcomed some illustrations of the clinical aspects—for example, common sites of lodgment of emboli and of the various methods used in their treatment by surgery Very appropriately the work of Swedish surgeons is referred to, but we should have liked to have seen Professor Einar Key's important personal contributions and those of his associates given even more prominence for it is to the Swedish school that we have been accustomed to look for some time now for guidance in the treatment of cases of arterial embolism British readers might think that undue importance is given to arteriectomy since many have failed to confirm the striking results claimed for this procedure, so popular in parts of the Continent Other explanations may be given for some of the results ascribed to sympathetic denervation by arteriectomy, since success has also followed embolectomy with ligature of the main vessels Making due allowance for such considerations, however, there is much to recommend this work to those interested in vascular surgery

A MEDICO-LEGAL CLASSIC

Glaister's Medical Jurisprudence and Toxicology By John Glaister M D, D Sc Sixth edition (Pp 747, 107 illustrations, 8 plates, 3 of which are in colour 25s net, postage 7d) Edinburgh E and S Livingstone 1938

In preparing the sixth edition of this famous book Professor Glaister decided that considerable changes were inevitable It was originally written for the student, and he found that it contained too much minor detail and interpolation in small type for modern tastes He has therefore opened up the whole format by using larger type and has improved the style of the index Considerable portions of the book have been recast in order to include new matter Dermal prints and palmar prints are treated in some detail, and the section on putrefaction now contains some useful data on the identification of maggots, for various species have life-cycles of various lengths The Ruxton case gives the editor an opportunity to enlarge the original section on the identification of dismembered remains He also includes the latest information on blood grouping the use of filtered ultra-violet light, the Pharmacy and Poisons Act, 1933, and war gases He has a large toxicological section, with two fine coloured plates of various poisonous berries and seeds As might be expected, Dr Glaister treats adequately one of the subjects he has made peculiarly his own the identification of fibres and hairs The civil aspect of medical jurisprudence is dealt with in a somewhat perfunctory way, but the section on the General Medical Council informs the practitioner of most of the pitfalls of the medical code of conduct A valuable feature is the close attention paid to Scots law, which in its medical aspects as in others, differs widely from the law of England The value of this work, already great, has been considerably increased by its learned and experienced editor

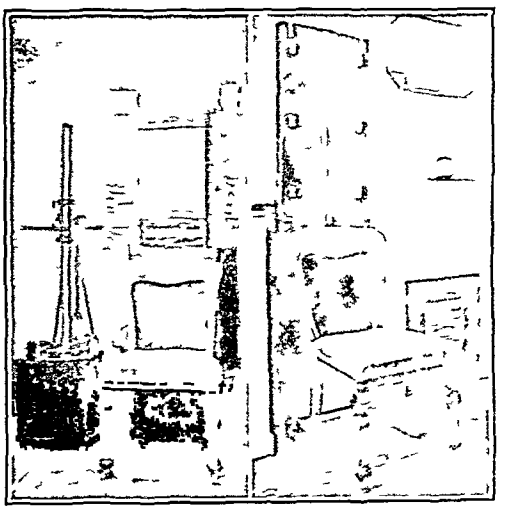
Notes on Books

Very opportunely since the Glasgow Exhibition will doubtless attract more than the usual number of visitors to Scotland this year, the Automobile Association has issued the *Road Book of Scotland* thus completing the trilogy of A A roadbooks covering Great Britain and Ireland The 400 pages which this book contains are packed with useful information, and, what is more, this mass of material is so arranged that whatever the reader wants to know—from the best of several possible routes to the size of the golf course at, say, Wick or (for the Englishman) the correct pronunciation of Gaelic names—that information is to be found with a minimum of effort There are more than 250 specially surveyed, detailed itineraries which are cross referred to a gazetteer of more than 800 cities, towns villages, and lochs Day drives from twenty-nine centres, chosen to cover the country as a whole, are described, and there is also a descriptive article with regional sketch maps on 'Touring in Scotland Sections of the book are devoted to mountaineering angling and shooting and miscellaneous information is to be found on steamship communications ferries and highland clans and lowland families Finally there are

excellent road maps in full colour on a scale of twelve miles to the inch Altogether a volume which no serious motorist in Scotland can afford to be without Its price to members of the A A is 8s 6d

It is an act of piety on the part of Dr Louis Sauve—himself a hero-worshipper—to save *Le Docteur Recamier (1774–1852)* from the oblivion into which he was fast sinking Recamier in his day was a great figure in French medicine as a physician surgeon and gynaecologist He was among the first to remove the uterine cervix by means of the ligature he invented a new form of speculum and he taught that cancer was at first a local condition which could be cured by early operation He came of old French stock His father was notary royal and mayor of Rochefort his godfather was Brillat Savarin the gourmet who wrote the *Physiologie du Gout* Recamier himself entered the Army of the Republic when the Terror was still at work He was present at the siege of Lyons in 1793 and then passed into the Navy to fight the English in the *Ca Ira* Eventually he became physician to the Hotel Dieu in Paris then surgeon to the charity for the profession was not then so strictly separated and he ended his life as Professor of Medicine in the Royal College of France His friends were numerous and included most of those who are familiar to us by their classical writings This little book (Paris Edition Spes 20 frs) is interesting to the general as well as to the professional reader It gives a first hand account of the state of affairs in France at the end of the eighteenth century when Recamier's pay was three hundred livres a month paid in assignats worth twenty sous a hundred in cash The father's income had been attached so the son had to live on his pay Dr Sauve reproduces a portrait of Recamier in middle age

Scientific Contributions in Honor of Joseph Hersey Pratt on his Sixty fifth Birthday is published at 7 dollars by the Lancaster Press Incorporated of Lancaster Pennsylvania A hundred and thirteen colleagues former pupils and friends of Dr J H Pratt of Boston, under the leadership of Dr Richard C Cabot pay this tribute to one who has done such notable service to the sick poor in such an effective and warm hearted manner Dr Cabot writes enthusiastically of Joe Pratt the pupil of Osler and Welch at the Johns Hopkins who thus inspired has been able to prove that scientific fervor and delight can be maintained at white heat in the cool climate of Boston for forty years More than thirty years ago he instituted his class method of helping tuberculous poor patients to get well in Boston and obtained as good results as those at Saranac Lake and other first class sanatoria another psychological but similar method of helping the sick poor the thought control class has also been strikingly successful Most of the articles here brought together have already appeared in the *Annals of Internal Medicine* and cover a wide field For example Sir Arthur Hurst writes on alcoholic gastritis 1833 and 1937 and Dr G C Shattuck a well known Boston name describes the incidence type and probable cause of anemia in the highlands of Guatemala It is interesting to hear that a hundred bedded Joseph H Pratt Diagnostic Hospital is to be constructed in honour of this famous physician



The first volume of the first series of the *New International Clinics* (Philadelphia Montreal New York J B Lippincott Co 4 vols 30s) appears under the editorship of Dr GEORGE MORRIS PIERSOL professor of medicine at the Graduate School of Medicine University of Pennsylvania and differs externally from the old series by appearing in a blue binding with a green label The volume contains seventeen original articles eight clinical lectures on a great variety of subjects and a review of recent contributions to the subject of biliary stasis and decompression

Preparations and Appliances

X RAY SCREENING STAND FOR GENERAL PRACTICE

Dr DOUGLAS GORDON (Richmond) writes

Radiology is not yet practised as generally as it is abroad and in the dental profession but with the introduction of shock-free apparatus it appears likely that the next decade will show a considerable increase of general practitioners with installations However even a shock free self protected x ray tube is not as safe as it sounds if used for screening chests I myself suffered from a sudden attack of alopecia within a few weeks of installing an x ray apparatus A complete cure was effected by constructing the screening stand here illustrated

The stand has the great merit that when not in use it occupies practically no space at all owing to the employment of a chair to keep it vertical and of wheels to permit of easy movement A 15 inch by 12 inch Lewis West screen with 10 mm lead glass slides in grooves in the two upright members and is capable of adjustment as is a small panel of wood and lead which lies below it in the grooves The vertical members are drilled and a brass rod passing through them retains both screen and panel Wheels are fitted at the bottom of the vertical members and strips of wood fix them to the back of the chair so that the chair legs prevent the stand being moved when in use but a slight tilt enables it to be wheeled about easily Protection is completed by lead apron fixed to the vertical members from the level of the top of the back of the chair down to within a few inches of the floor and laterally by four hinged flaps of lead and wood as seen in the illustrations The two upper serve the double purpose of protecting the observer from x rays and when shut of protecting the screen from sunlight The lower flaps fold back on double hinges when not in use The range of adjustment available suffices for all chests and a suitable stool or box for the patient to stand on permits screening of the abdomen Omitting the cost of the Lewis West screen and of the chair the whole apparatus was constructed for less than £2

APPLE DIETARY

Aplona (Messrs Coates and Cooper) is a German dietary preparation made from apples It contains 1 per cent tannins cellulose and pectine Clinical reports have been received that it is valuable in the treatment of diarrhoea both in children and adult

Nova et Vetera

ST HELENA AND ITS HISTORY

In *St Helena 1502–1938* Dr Philip Gosse has produced not only an important historical work but also a vivid and interesting narrative of the island's chequered story[1] To the great majority St Helena is known solely as the place of Napoleon's second captivity and previous writers have devoted themselves almost entirely to the last days of the illustrious exile Dr Gosse, however, has wisely refrained from allowing any undue concentration upon this over-written period to upset the careful chronological balance of his book This is to be commended, for both the romantic early history of the island and the reasoned and sympathetic survey of the deplorable conditions existing at the present day are more worthy of the reader's attention

An uninhabited island, St Helena was first discovered by the Portuguese admiral, da Nova, in 1502, and for eighty-six years, realizing its great importance as a calling station for their homeward-bound argosies from the East, the Portuguese succeeded in keeping the discovery to themselves Then the English and Dutch came upon the scene, and there followed a period of sea-fights and assaults, of which Dr Gosse with his wide knowledge of the old sea-rovers, is well fitted to write Turbulent too, was the internal history of the island, disturbed by frequent mutinies, and marred by the cruel treatment of the black slaves who had been imported under the auspices of the East India Company, to furnish labour for the plantations and farms The East India Company, nevertheless was lavish in its expenditure upon this vital link in its sea communications and the transference of administration to the Crown in 1833 dealt a sad blow to the island's prosperity The opening of the Suez Canal and the gradual disappearance of sailing ships sounded the knell of St Helena's former glories and the island is to day impoverished and neglected

Dr Gosse has supplemented his text with nine most interesting appendices, one of which contains a complete list of Governors from 1657 to the present day Among these is Dr W J J Arnold, colonial surgeon who was acting Governor in 1911 and in 1924 So beloved was Dr Arnold by the community, to which he devoted the best years of life, that a monument was erected to his memory, bearing the inscription, "The best friend St Helena ever had This book, written with scrupulous accuracy and at the same time with sympathy and humour, may deservedly be regarded as the standard work on St Helena The illustrations are numerous and well chosen

FRANCESCO ANTOMMARCHI, 1789-1838

Of all the petty men who walked under the huge legs of the Colossus Napoleon one of the strangest and least attractive was his compatriot Dr Francesco Antommarchi, the centenary of whose death occurs this year Sir Arthur Keith has called him the Malvolio of the drama of St Helena Born at Morsiglia, in Corsica, he studied medicine at Pisa and Florence and in 1812 became prosector to Paolo Mascagni (died 1815), whose beautiful illustrations for an anatomic atlas were entrusted to him for publication These he began issuing in 1819 (*Prodromo della grande anatomia*) but his methods were so questionable that Mascagni's family soon chose other editors

When Napoleon's Irish physician Barry O'Meara was sent home on July 25 1818, Antommarchi, at the request of the Emperor's mother and of her brother, Cardinal Joseph Fesch, went to St Helena in 1819 He was then but 30 years old Though a skilled anatomist and pathologist he was an inexperienced and incompetent physician—excitable, unbalanced, vain, *pretentious, and greedy* Towards the sufferings of his patient he was scarcely sympathetic, believing them to be simulated for political ends Napoleon's dread of having inherited cancer from his father, who died at the age of 39, Antommarchi tried to quiet by asserting that cancer was not inheritable The patient frequently tried to get rid of his doctor, saying 'I would give him my horse to dissect, but I would not trust him with the cure of my own foot' Though he performed the post-mortem examination, Antommarchi refused to sign the official report He is suspected by Sir Arthur Keith of having abstracted the portions of Napoleon's *intestine which are preserved in the Museum of the* Royal College of Surgeons (*British Medical Journal*, 1913, **1**, 53–59)

A Spurious Attribution

Antommarchi's name is illegitimately linked with the so called Antommarchi death-mask of Napoleon, which was really the work of Dr Francis Burton, surgeon to the 66th Regiment of Foot, the face part of the mould having been stolen by the Corsican In 1825 Antommarchi published his worthless and mendacious book *Derniers Moments de Napoleon* in which he gave a fabricated account of how he had moulded the mask Very providentially for his rival, Burton died of pulmonary apoplexy in 1828, when Antommarchi decided that the time was now ripe for reproducing the mask and placing casts upon the market for sale On July 15 1833, he issued a prospectus and invited subscriptions Though the mask was exquisitely beautiful—in its youthfulness it recalled the First Consul rather than the Emperor—with its receding and narrowing forehead and commonplace skull, it was so unlike his conventional head that the response was most disappointing In disgust Antommarchi retired to Cuba and died at Santiago at the age of 49 His fraud was publicly exposed at Dublin in 1835 by Robert James Graves (of Graves's disease fame), a cousin of Burton, some of whose papers he had inherited, and Burton's claim was resurrected in *1900* by Lord Rosebery in his book, *Napoleon The Last Phase* The story of the death-mask was told convincingly with the aid of original documents by G L de St M Watson in 1915 Though Heine calls him an evangelist of the worldly saviour Antommarchi seems to have had scant regard for historical accuracy and truth It was he who invented the theatrical tale—repeated to this day—that when Napoleon lay dying a violent tempest was raging over the island, tearing up every tree which the exiled Emperor had cherished

W R B

While a medical student at the University of Gottingen Arthur Schopenhauer who was born 150 years ago contracted syphilis, which was treated with huge doses of mercury so popular at that time The accompanying wretchedness of *salivation, depression, and internal pain were responsible for* his lifelong syphilophobia and out of his hatred of women—under sized, short legged, long haired creatures whose sole purpose in the world was to spread syphilis—grew his philosophy of pessimism In commemoration of this anniversary Danzig his native city, has recently issued a set of three stamps bearing his likeness

---

Sir Walter Farquhar, Bt, M D, who was born in *Scotland* 200 years ago, served as army surgeon under Lord Howe commander in chief of the British Army in the American Revolution, and was present at the siege of Belleisle in 1761 On his return to England he started practice as an apothecary, was created baronet in 1796 and shortly afterwards became physician in ordinary to the Prince of Wales He died on March 30, 1819

SATURDAY JULY 2 1938

NATIONAL INSURANCE IN AUSTRALIA

In the *Journal* of June 11 last (p 1279) the provisions of the Bill for National Insurance and Pensions in Australia were described The Bill had then received its second reading in the Federal House of Representatives Its subsequent course has not been altogether a smooth one Within the House the Labour Party put up a dogged opposition mainly on the ground that any such scheme should be non-contributory while on the other hand certain of the Government s own followers especially a section of the Country Party, pressed for various extensions of its proposals so that some farmers and employers with small incomes as well as the dependants of insured persons should be provided for Outside Parliament the friendly societies fearing that the Bill might affect adversely their present position expressed their dissatisfaction and the general body of the medical profession attacked a number of its proposals in no uncertain way It was only by the firmness of the Prime Minister and by the application of the 'guillotine that the third reading was secured by a small majority Even so Mr Lyons had to promise to appoint a Royal Commission to consider the capitation fee for medical practitioners giving service and the inclusion of the dependants of certain classes of insured persons and to consider the establishment of a voluntary scheme for small employers with a rebate of the contributions on behalf of their employees The Bill went to the Senate on June 21 and it is understood that it has now been passed without substantial alteration

The conduct of the negotiations between the Australian Government and the Federal Council of the British Medical Association on behalf of the medical profession in the Commonwealth has not been satisfactory No doubt both the Government and the Federal Council were in a difficult position The former understandably but we think unwisely did not wish to make any public disclosure even of its main proposals until the Bill was introduced into Parliament The latter was thus placed in the position of negotiators who were unable to assure themselves of the reaction of the general body of those whom they represented to important points which they were prohibited from disclosing during a vital period

Observations on the position especially as regards details made under the handicaps of distance and of time must necessarily be guarded It is possible that there are factors as to which full information has not been forthcoming but criticisms made as the result of actual experience may be helpful There is no doubt that a considerable number of members of the medical profession in Australia regard any scheme of national health insurance as unnecessary and as likely to be injurious to professional work and traditions Such an attitude comparable to that taken up by many in Great Britain a quarter of a century ago is mainly due to misunderstanding as to the nature and effects of such a scheme in actual working These have proved to be not unsatisfactory in this country and there is no reason to suppose that in Australia if regard is had to that twenty five years experience and to its application to conditions in some respects different a similar scheme will be a social measure other than beneficial alike to the profession and to insured persons Further if uniformly administered throughout the Commonwealth it would seem to offer the best means of relieving the profession and the people of Queensland and of Tasmania from the worst effects of the attitude of the Governments of those States to the medical profession In any case the Australian Government is redeeming promises definitely made during an election from which it emerged with success

The chief differences between the Government and the medical profession now appear to be with regard to the capitation fee and mileage and to the content of the service It would seem that in the original negotiations the decisions arrived at were that the capitation fee for a general practitioner service excluding treatment in respect of a confinement and treatment of an insured person who becomes entitled to the benefits of any Commonwealth or State Workers Compensation Act or Seamen's Compensation Act and excluding major operations and inhalant anaesthetics be eleven shillings and that mileage be payable at the rate of two shillings a mile one way beyond three miles with an increased rate for areas of special difficulty The present demands of the profession are that the capitation fee shall be fourteen shillings with a 25 per cent increase for country areas that mileage shall be 2s 6d a mile beyond two miles sixpence of this to be payable by the patient that there should be an

extra 2s 6d fee payable by the patient for calls between 8 p m and 8 a m , that, in addition to the administration of general anaesthetics, the following should be excluded from the service—attendance for acute alcoholism and acute venereal disease, attendance for miscarriages and abortions and premature births, and attendance for " the more difficult and complicated fractures and dislocations "

A capitation fee of eleven shillings, having regard to differences of exchange, cost of living and other conditions of practice, must be regarded as entirely inadequate A case put forward to the Commission now promised by the Government should certainly be successful in securing a substantial increase upon this It must be remembered that when the lower amount was decided upon medical attendance on workmen's compensation cases was to be excluded from the service Experience here shows that it would be both undesirable and very difficult to exclude this, but that the amount of such attendance is considerable , and the Commonwealth Government should surely recognize that, if it is not now to be excluded, this in itself constitutes a reason for a higher fee Experience tends to show also that it would be unwise and inconvenient to exclude acute alcoholic and acute venereal cases from the contract, and the same applies to miscarriages and abortions, though perhaps less emphatically , but of course the work entailed by these troublesome cases should be reflected in the capitation fee With regard to major fractures and dislocations, it may be that they are excluded as requiring, except for emergency treatment, specialist skill On the other hand there is much to be said, in the conditions of Australia, for a higher mileage fee and for a modest fee for night calls, some portion of which, in both cases should be a liability on the patient It may be suggested however, that the practitioner should be paid these fees not by the patient but from the insurance fund, that fund obtaining payments into the fund by the insured person

Proper pressure on the Government on these points with regard to capitation fee, mileage, and night calls, with the presentation of a well-prepared case to the proposed Royal Commission, is called for, and it is to be hoped that the profession in Australia will be united in presenting reasonable demands upon such points as these The principle upon which the whole matter should be based is that the profession should offer not an unduly restricted service but a full and efficient service, and that the Government in return for this should guarantee such remuneration as will encourage and suitably reward good work and great responsibility

THE VOLUNTARY SYSTEM IN FIGURES

The voluntary hospitals are a long time dying It might be argued that they are no longer voluntary in the sense of the words which are still to be seen over the entrances of many of them—" Supported by voluntary contributions "—for voluntary gifts in the shape of subscriptions, donations, congregational offertories, even including workmen's contributions, Hospital Saturday funds, and contributory schemes, amount in all to much less than half the income available for maintenance But as Mr R H P Orde, editor of *The Hospitals Year-Book*,[1] points out in a foreword to the new edition, the reference to voluntary contributions has largely obscured the picture The really important characteristics of the voluntary system are not the sources of income but the absence of statutory control and of the desire to make any profit out of the treatment of the sick

With that definition in mind it is worth while examining some of the massive statistics presented in the yearbook They relate to 1936, the last year for which complete figures are available During that year 1,378,050 patients were treated in the wards of the voluntary hospitals of Great Britain and Ireland, and 6,216,497 in their out-patient departments These figures show increases over the previous year of 52,614 in-patients and 272,544 out-patients The growth of the out-patient department catches the eye everywhere in the procession of statistics In the London hospitals alone the number of new out-patients in the year was just upon two millions, an increase of 80,000 on the year before At the twelve London hospitals associated with medical schools the new out-patients numbered well over three quarters of a million At two of them (the London and St Thomas's) the number in each case was over 100,000 At this rate the out-patient clinics will vie with the cinema as the place of resort for the British people The same story is repeated at the special hospitals At the four large ophthalmic hospitals in London, for example the new out-patients numbered 72,000 The cost of out-patients is rather difficult to assess, and the disparity of some of the figures in the analyses suggests that different methods are taken by different hospitals At the Birmingham General Hospital for example, the remarkable figure of 6s 8d is returned as the cost per out-patient attendance, but in general at the provincial teaching hospitals the figure works out at something over one shilling, and at the London teaching hospitals it averages just over two shillings

[1] *The Hospitals Year Book 1938* (Central Bureau of Hospital Information, 12, Grosvenor Crescent S W 1)

An interesting section of the report this year deals with hospital nurses In the London hospitals associated with medical schools the number of beds per member of nursing staff varies from 2·46 at St Mary's to 1·34 at Guy's and at similar hospitals elsewhere in the country from 3·05 at Aberdeen Royal Infirmary to 1·97 at Addenbrooke's Hospital, Cambridge Very few hospitals whatever their size, have more than four beds per member of nursing staff The average for the 800 hospitals furnishing complete particulars on this point is 2·36 in the case of the general hospitals and 2·84 in the case of the special the special including such places as the spa hospitals where the number of beds per nurse may be from ten to fifteen On a summary of information from a number of large provincial hospitals the number of hours' duty per week for the day staff (excluding times taken for meals) is about fifty-five and for the night staff very generally over sixty Typical salaries for matrons of large provincial hospitals are £400 for ward sisters £90–£150 for staff nurses £60–£80 and for fourth year probationers £40

The financial position of the voluntary hospitals in 1936 may be summarized by saying that they received £17 680 000 and spent £17 167 000 Returning prosperity to the nation brought the hospitals a welcome increase in voluntary gifts the total of which was £6 071 000 a gain of not far short of £300 000 on the year The only diminution was in Scotland But the cost of running hospitals is generally rising reflecting the rising price level and the fear of a deficit is ever present in the minds of hospital managers An independent view of the whole situation was put forward the other day by Professor Ernest Barker who holds the chair of political science at Cambridge in an address to the British Hospitals Association on 'The State and the Voluntary Hospitals'.[2] The deficits of the hospitals said Professor Barker were in no sense the result of bad management Hospitals had developed into organized co-operative concerns and their problem now was how to meet their deficits The method of setting wards aside for paying patients might vitally affect the very essence of the voluntary hospital and turn it into a quasi-commercial nursing home The only solution now is the way which adds State charity to the resources and achievements of private charity When the community gives as well as private persons, it makes a fairer and more equitable world In answer to the question how aid should be given by the State Professor Barker put forward the analogy of universities The University Grants Committee receives an annual Parliamentary grant of some £2 000 000 and distributes this among the universities attaching no specific conditions A Hospital Grants Committee might receive an annual Parliamentary grant and probably a system of regional hospital councils acting on behalf of the committee in the same way as the central federal authority of the University of London acts on behalf of the University Grants Committee might be a further necessity' He claimed that this idea was in tune with the general English way of doing things So far from defeating self help or drying up the springs of private charity it was likely to stimulate and increase them The grants made by the State to universities have not diminished the private support and the private endowment of universities The plan is an economic one and a good and valid alternative to the other and far more costly method to which we might otherwise be driven—the method by which the State owing to the failure of unassisted voluntary effort to face the gigantic task of maintaining voluntary hospitals would be forced to take them over and to run them at a far greater cost

THE CYCLOTRON

Scientific progress depends no less upon the production of new research tools than upon new ways of thinking and the cyclotron in this respect bids fair to rank with the x ray tube the microscope and the magnet Its inventor Professor E O Lawrence wished to produce high speed ions of sufficient energy to penetrate and disrupt atomic nuclei Ions can be accelerated by the application of an electromotive force and a variety of apparatuses have been made—for example the impulse generator or the high voltage x-ray tube—in which about a million volts can be applied to the ion source Difficulties of insulation at present stand in the way of further development of such apparatus and Lawrence therefore thought of repeatedly accelerating the ions by the successive applications of a voltage of the relatively low order of about 40 000 volts An ion can be made to traverse a circular path by the application of a magnetic field at right angles to the plane of the circle and the angular velocity of such a moving ion is constant If now the linear velocity of the ion is increased by the application of a voltage in the plane of the circle the ion will travel in a larger circle and by repeated accelerations its path becomes an ever widening flat spiral In the cyclotron the ions formed near the centre point between two semicircular hollow electrodes spiral around from within one electrode to within the other under the combined influence of a high frequency oscillating field between the electrodes and a magnetic field perpendicular to the plane of the electrodes The frequency of the oscillations and the strength of the magnetic field are so adjusted that the

ions remain in resonance with the oscillator, and after perhaps a hundred revolutions the spiral has opened up to the limit permitted by the size of the accelerating electrodes, and the ions are drawn off their track by about 40,000 volts applied to a deflecting electrode They then strike a beryllium target with an energy approaching six million volts, or they may pass through a very thin platinum window into the air The ions used are as a rule those of heavy hydrogen (deuterons), the cyclotron in steady operation gives 7 micro-amperes of 5-million-volt deuterons, and the neutron emission from a beryllium target bombarded by this deuteron beam is equivalent to that which might be produced by something over 50 kg of radium in a beryllium mixture There are two cyclotrons at present in course of construction in this country (for Cambridge and Liverpool), and one is also in process of installation at McGill University The latter has been made the occasion by J S Foster for a paper[1] showing the contacts of the cyclotron with x-ray and radium therapy The cyclotron makes available a variety of high-speed particles which are not emitted by radio active substances found in nature—protons, deuterons, neutrons —as well as producing particles which also occur naturally (for example, alpha particles) in considerably greater number than from a radium source of average size Such high-speed particles may be used directly for therapeutic purposes (a beginning has already been made with electrons and neutrons), or they may be used to produce artificially radio active substances In a day's bombardment of sodium metal with deuterons an amount of radio-sodium having a gamma-ray activity equivalent to 200 mg of radium is produced, the end-product of radio-sodium is magnesium, and there are a number of artificial radio active elements which similarly lead to harmless end-products It is therefore possible to inject such radio active elements into the blood stream, and J C Hamilton and R S Stone have already administered radio-sodium intravenously in the treatment of leukaemia Lawrence has himself obtained good results up to date in a case of myeloid leukaemia treated by radio-phosphorus When injected into the body phosphorus is to a large extent selectively absorbed into bony tissue it is clear, then, that radio-phosphorus will be brought into close proximity to the proliferating elements of bone marrow, and its use in the treatment of leukaemia should supersede that of radio-sodium There are now more radio-active nuclei known than stable ones, so that the selective absorption of different elements by different tissues opens up wide therapeutic possibilities As Professor John Beattie pointed out in his first Arris and Gale Lecture last week, the discovery of such a selective element for cancer tissue would place a powerful therapeutic agent in our hands The introduction of radio active compounds into an organism also makes manifest the movement and disposal of the element concerned, so that the use of radio active indicators is likely to prove of great value in biochemical research

MILK AND NUTRITION

The first report of the Milk Nutrition Committee, which was published some months ago, dealt with the results of experiments carried out on rats at the National Institute for Research in Dairying at Reading and at the Rowett Institute, Aberdeen Careful comparisons were made between raw and holder-pasteurized milk, and the conclusion was drawn that the total nutritive value of milk for rats was not significantly diminished by this type of heat treatment The second volume,[1] now published by the committee, records a series of observations on the effects of adding milk to the dietary of school children The observations were carried out on an extensive scale in five different areas—Luton, Wolverhampton, Burton-on-Trent, Renfrewshire, and Huddersfield In each area the children were divided into four groups Group 1 received biscuit with a calorie value of 52, Group 2 received one-third of a pint of pasteurized milk, Group 3, two-thirds of a pint of pasteurized milk, and Group 4, two thirds of a pint of raw milk In any one area the raw and pasteurized milk came from the same source of supply The total number of children, who were between 5 and 14 years of age amounted to 2,000 in each group The experiment was conducted over a complete school year Assessment of the state of nutrition was made by physical measurements, clinical examination, and certain functional tests, the children being examined at three monthly intervals The data have not yet been completely analysed, and the present report refers mainly to the increases in height and weight of 6 099 children who attended school regularly and were present at all four medical examinations The general results showed that children on a milk supplement increased both in height and weight to a greater extent than children in the control group on the biscuit supplement, and that the children given two-thirds of a pint of milk reacted more favourably than those given only one third of a pint The absolute differences however, between the average increment of height and weight of the groups given milk and the control group on biscuit were very small Comparing, for example, the extreme groups—namely, those on biscuit and those on two thirds of a pint of milk—they did not amount to more than 0 1 inch in height during the year or to more than two-thirds of a pound to one pound in weight The reasons for this are not known with certainty, but it is thought that the total quantity of milk given as a supplement was too small to produce any considerable increase in growth It may be noted, too, that no control was exercised over the dietary of the children in their homes, and there is some reason to suspect that children receiving biscuit in school may have received extra milk at home and that children receiving milk in school may have had their home ration of milk reduced Particular interest attaches to the behaviour of the children on two-thirds of a pint of raw and those on two thirds of a pint of pasteurized milk

[1] *Milk and Nutrition* Part II The Effects of Dietary Supplements of Pasteurized and Raw Milk on the Growth and Health of School Children National Institute for Research in Dairying Shinfield Reading Price 1s 9d, post free

In the different age sex and place groups the reaction of the children varied but taking all groups together no significant differences in either height or weight increase could be shown between the children on raw and those on pasteurized milk It is pointed out that the absolute increases were so small that a real difference in the nutritional value of raw and pasteurized milk may possibly have been obscured No definite evidence however was obtained to suggest the occurrence of this possibility The findings in fact are similar to those which have emerged from a number of experiments in recent years on both rats and calves and add further support to the conclusion that holder pasteurization has no significant effect on the nutritional value of cow s milk for the human subject

VIEW-DAY AT THE N P L

What is known as the annual inspection of the National Physical Laboratory occurred on June 28 when visitors were received by Sir William Bragg President of the Royal Society and by his son Dr W L Bragg who is director of the Laboratory The reception took place in the immense hall which houses the million volt electrical plant The journalists present before being taken on a Press tour of the many buildings in which the work of the Laboratory is carried out were handed two documents one prepared for the popular press and the other for the technical As the one prepared for the popular press contained such terms as audio frequency modulations iron-cored inductances and 'rotating coil direction finders the terminology of the one prepared for the technical press may be left to the imagination The fact is that such highly specialized work as is done at Teddington can never be popularly described It uses and depends upon a language which is foreign not only to the man in the street but also to workers in scientific fields other than physics Science can never really come down and explain itself in simple gospel those who would learn its language must first learn its grammar At the same time there was a great deal on view which in its applications if not in its process was of general interest The Laboratory is at present carrying out many investigations on noise in particular the noise of aircraft and of tube trains It has also put up a special double walled building to determine the causes and the nature of the noise made by motor-cycles with a view to its analysis and reduction Another interesting exhibit concerned tooth structure Knowledge is still accumulating about the structure of both diseased and sound teeth Photomicrography radiography and crystal analysis are all pressed into this service The exhibits showed how the enamel perhaps a millimetre in thickness has an outer layer which is more highly calcified than the remainder with less calcified regions at the inner and outer boundaries of the dentine The orientation of the constituent crystals which are accessible only to x ray analysis was demonstrated The testing of radium at the Laboratory was as always of interest, also the testing of clinical thermometers to the number of some 1 400 daily One of the pieces of work which attracted most attention has been done for the Meteorological Office and takes the form of a short wave radio transmitter which is sent up in a small balloon The changes of pressure and temperature which it encounters in the upper atmosphere are indicated by changes of frequency in its continuous transmission and these indications are received and measured on the ground Not only so but a parachute is attached to the apparatus so that when the flight is ended by the bursting of the balloon the transmitter is retrieved generally undamaged Heights up to nine miles have been reached with good reception throughout It has always been a matter for surprise that meteorology does not seem to advance to the same extent as other physical sciences As it is we are still at the mercy of the weather and we cannot even forecast its changes with absolute accuracy Perhaps the meteorological balloon with the short wave radio transmitter will usher in a new era but for the time being a cautionary note has to be put in the programme that the demonstration of the balloons must be subject to weather conditions

THE PREVENTION OF INDUSTRIAL EYE INJURIES

An exhibition designed to call attention to the need and possibility of prevention of industrial eye injuries was recently arranged at the Royal Eye Hospital in Southwark Part of the exhibition was staged only for a day or two but another part is intended to be permanent and to form at the hospital a museum of protective devices and graphic instruction The need for caution is brought home by posters and admirable photographic enlargements the different kinds of goggles used in grinding riveting welding and other occupations also the anti glare and anti dust goggles used by air pilots are shown and finally the safety measures adopted in well known factories gasworks and transport undertakings are presented The purpose is to bring home to the public especially the industrial worker the risk of eye injury which many operations entail and the simplicity of the means of protection—such as goggles or safety screens—which may be employed An admirable film by Kodak Ltd has been prepared with the same object in view and was shown at the opening of the exhibition It was made in the wards of the hospital and in adjacent factories It represents a workman who is supposed to have sustained an eye injury through the neglect of a simple precaution and who is taken to the Royal Eye Hospital examined by the surgeon and has a splinter removed from his eye by a giant magnet Mr J Minton of the hospital staff to whom much of this enterprise is due before showing the film referred to the thousands of preventable accidents every year large economic loss and the fact that in many partial or complete blindness resulted Act he said will assist the compensation

and other protective appliances, but only a long and continuous campaign of education of workmen will bring about a real diminution of these injuries Another task to which the hospital is setting itself is the re-education of the workman who has lost an eye A re-education clinic is to be established, so that the workman can be taught to adjust himself to his new visual perceptions and to estimate distances and heights and depths The Earl of Athlone opened the exhibition, and in asking him to perform the ceremony Mr L V Cargill, chairman of the hospital, said that the number of industrial eye accidents to which the hospital had to attend reached 7,700 in 1937 Accordingly an Industrial Eye Injuries Committee had been set up, and one of its first efforts was this exhibition, which was intended to bring home to employers and workpeople in the area of the hospital in South London the usefulness of safety devices The staff of the hospital are to be congratulated on the active steps they have taken Eye hospitals in other localities might follow the example set

LONDON EMERGENCY BED SERVICE

The object of the Voluntary Hospitals Emergency Bed Service, as fully explained in two recent issues of this *Journal*,[1] is to facilitate the admission to voluntary hospitals of emergency and acute cases to the mutual advantage of the patient, the doctor, and the hospital Nearly every voluntary hospital within eleven miles of St Paul's Cathedral is co-operating When a medical man has an emergency or acute case which he wishes admitted to a voluntary hospital he should ring this service (telephone, Metropolitan 8781) He will then be asked to give his name and telephone number, the patient's name, age, and sex, and the diagnosis If he then states to which hospital he wishes the patient admitted the operator will tell him whether there is a bed vacant, and if there is will book it for him If there is not he will be asked to state his next preference, and so on until his requirement is met By this means the practitioner can ascertain whether there is a free bed at any or all of the hospitals which he may think suitable for his patient with the least possible delay In the case of certain hospitals which have undertaken to bear the cost of the ambulance it will be possible for the service to book an ambulance for him and it is hoped to extend this arrangement to cover all hospitals in due course The service started on June 21, and is open every day from 8 a m to 10 p m , Sundays and holidays included There is no charge since the cost is being met by King Edward's Hospital Fund for London Emphasis should be laid on the point that the service is intended to deal with acute and emergency cases only, and that hospitals must preserve the right to refuse to retain in their wards any case admitted thereto under this scheme which does not require immediate medical or surgical treatment The office is at 10 Old Jewry, E C 2 and the secretary is Mr R E Peers

British Medical Journal June 4 p 1221, June 18, p 1325

KEY TO CURRENT MEDICAL LITERATURE

The end of the first volume of the *British Medical Journal* for this year saw the last of the old *Epitome*, which has been a familiar feature to readers for a good many years There was no doubt that the *Epitome* was widely read and also no doubt that during recent years it was read with a certain sense of disappointment, it had not fulfilled the bright promise of its early youth The growing volume of medical journals and the increase of specialism and specialties made it impossible to do justice to these in the limited space of four, or occasionally six, pages of the *Journal* Nor was it possible to do justice to those subjects classified in the *Epitome* The mould in which it was cast was too small and did not allow for expansion In the new "Key to Current Literature," which appears for the first time this week, we have tried to obviate some of these difficulties and to make our weekly survey of medical journalism more comprehensive, and so, we hope, more valuable to both the specialist and the general reader The periodicals received are arranged in two groups—general and special—and under the title of each appears a list of the original articles in it, a translation being given when they are in a foreign language Below the list of titles appear brief abstracts of certain selected articles These abstracts are short and factual, and their purpose is to guide the reader to the original article itself They are not intended to provide hints and tips for practice, nor to serve as a happy hunting ground for the writer of a short paper who wishes to appear learned by adding to it a long list of references to articles he has not read and is never likely to read The new Key is, in fact, meant to be a Key, and as such will, we believe, be of value to a wide circle of readers

A general meeting of Fellows of the Royal Society of Medicine will be held at 1, Wimpole Street, W , on Tuesday, July 19, at 5 30 p m , when the Jenner Medal of the Society will be presented to Sir Arthur Newsholme, K C B , M D

On the afternoon of Tuesday, July 19, Queen Mary will open the new surgical wards and research department of the National Hospital for Diseases of the Nervous System, Queen Square, London

The Corporation of the City of London has appointed Dr Montagu Travers Morgan as medical officer of health for the Port of London Dr Morgan graduated in medicine at the University of Liverpool in 1912, and is at present a medical officer under the Ministry of Health, being associated particularly with port health administration ships sanitation, and the welfare of merchant seamen He was formerly county medical officer for Pembroke and county tuberculosis officer for Herefordshire

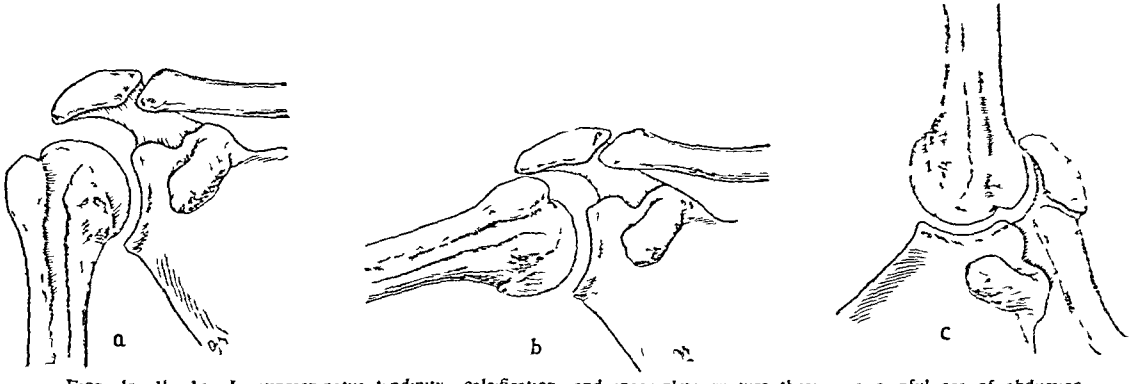
SURGICAL PROCEDURES IN GENERAL PRACTICE

This is one of a series of articles contributed by invitation

INJURIES IN THE REGION OF THE SHOULDER-JOINT

I. CAPSULE AND TENDON INJURIES

BY



R. WATSON-JONES, M.Ch.Orth., F.R.C.S.

Shoulder injuries other than fractures and dislocations are often misunderstood and indifferently treated because neither the functional importance nor the vulnerability of the supraspinatus tendon is recognized. The majority of the painful shoulders of domestic life are due to minor injury of this tendon and complete rupture though rarely diagnosed is a common and disabling industrial accident. The tendon of the supraspinatus with that of the subscapularis and of the infraspinatus on either side forms a thick continuous fibrous sheet fused with the underlying capsule of the shoulder-joint and separated from the deltoid and the acromion process by the subdeltoid bursa. With every abduction movement of the shoulder, particularly through the range of 60 to 120 degrees there is impingement and friction of the supraspinatus tendon against the acromion process (Figs. 1a, 1b, 1c). It is to minimize this friction that the subdeltoid bursa lies between the two structures. As years go on especially in the case of labouring men accustomed to strenuous shoulder exercise the protection of the bursa becomes inadequate and the constantly repeated trauma gives rise to degenerative changes in the tendon and capsule. The fibres undergo wearing and attrition—*supraspinatus tendinitis*. This degenerative process occurring in a relatively avascular tissue may lead to a calcareous deposit—*supraspinatus calcification*. The worn and necrotic fibres become unusually susceptible to injury a simple fall or a sudden muscular effort may cause incomplete or *complete rupture of the supraspinatus tendon*. In the more severe cases the tendinous and capsular degeneration extends to the bicipital groove and accounts for *spontaneous rupture of the biceps tendon*. Years of latent tendinitis possibly associated with a distant toxic focus may be lighted up by a simple strain to culminate in an attack of periarthritis with *periarticular adhesion formation*.

Supraspinatus Tendinitis

The symptoms are often attributed to a minor strain and the patient complains of pain on the outer aspect of the shoulder and over the deltoid insertion. It does not radiate to the elbow and forearm as in brachial neuritis due to cervical osteo-arthritis. There is tenderness on pressure accurately localized to one spot—the great tuberosity of the humerus where the supraspinatus tendon is inserted. Movement is not limited in any direction but there is an acutely painful arc of abduction between 60 and 120 degrees—the range during which the tender area impinges against the margin of the acromion. Movement of the limb by the side is painless. When the painful arc is passed the tender region lies protected beneath the acromion and not in contact with it and movement is again entirely painless. As the arm is brought down to the side there is once more sharp pain from 120 to 60 degrees of abduction. Radiographic examination shows no abnormality.

Dramatic results may be secured by injecting 5 to 10 c.cm. of 2 per cent. novocain into the painful area. The skin is anaesthetized and the point of the needle is introduced into the tendon and capsule. Pain is at once relieved and for the first time the patient is willing to move his arm freely and without caution in all directions. He must be warned however that within five or six hours as the analgesia passes off pain will recur and may be intensified. Morphine may be necessary. The exacerbation generally subsides within a few days and in many cases the symptoms are permanently relieved. Presumably the infiltration of the tissues is followed by an irritative reaction causing swelling which temporarily increases the effect of impingement against the acromion and hyperaemia by which the degenerated avascular tendon is subsequently revascularized. If the symptoms are incompletely relieved by the injection diathermy and radiant heat are of value in encouraging the necessary revascularization.

FIGS. 1a, 1b, 1c.—In supraspinatus tendinitis calcification and incomplete rupture there is a painful arc of abduction between 60 and 120 degrees due to impingement against the acromion. There is no impingement and therefore no pain when the arm is by the trunk or by the side of the head.

Calcification of the Supraspinatus

The symptoms and clinical signs of supraspinatus calcification are identical with those of tendinitis without calcification and the conditions are to be distinguished radio

graphically The deposit of amorphous calcium carbonate and phosphate is of the consistency of tooth-paste and lies wholly enclosed within the tendon fibres Its volume so increases the degree of impingement against the acromion that abduction movement beyond 60 degrees may be far too painful to be attempted With large deposits the patient sits and stands with the arm hanging from the shoulder, to increase as far as possible the space between the humerus and the acromion, the support of a sling may be intolerable

Whereas simple supraspinatus tendinitis is very common, tendinitis with calcification is rarely seen The source of the calcareous deposit is the impairment of blood supply from preceding tendinitis But the calcareous mass at once produces a secondary irritative hyperaemia in the adjacent tissues, which may not only cause spontaneous absorption of the calcium but also cure the underlying tendinitis Small deposits should therefore be treated conservatively by diathermy, radiant heat, and massage The limb should not be supported in an abduction frame, because abduction is the most painful position of the joint Active exercises are encouraged as soon as possible

Large deposits should be removed through a two-inch incision The mass is usually too inspissated for removal by aspiration The deltoid is split, the subdeltoid bursa is incised, and a greyish-yellow mass is seen enclosed within the tendinous and capsular fibres The fibres are divided in their long axis and the granular paste is evacuated with a small spoon There is immediate and complete relief from the pain, and full active exercises can be practised at once

Complete Rupture of the Supraspinatus

Although there is no doubt that the earlier degenerative changes of supraspinatus tendinitis predispose to rupture of the fibres, complete rupture of the supraspinatus tendon usually follows a definite injury—a fall or a severe muscle strain—in middle-aged hard-working men Occasionally it occurs as a complication of dislocation of the shoulder or fracture of the upper end of the humerus There should be no difficulty in establishing the diagnosis, for active movement of the shoulder is seriously restricted The diagnostic sign is a greater limitation of active than of passive abduction in the presence of a normally contracting deltoid

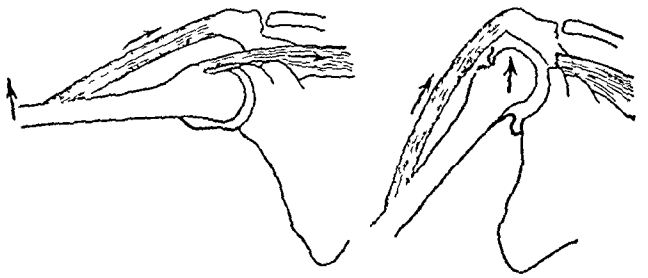


FIG 2.—Active abduction by the deltoid is only possible if the head of the humerus is fixed by the supraspinatus If this tendon is ruptured weak abduction to 60 degrees by scapular movement is all that is possible

The humerus cannot be abducted by the deltoid alone, however powerful it may be, the supraspinatus is an essential synergist Like the workman's mate who stands on the bottom rung of a ladder to prevent sliding while it is elevated to the vertical position, the supraspinatus must anchor the head of the humerus to the glenoid to provide a fulcrum from which leverage can be obtained by the deltoid (Fig 2) If the supraspinatus is inactive strong contraction of the deltoid pushes the head of the humerus up towards the acromion and holds it there while the scapula rotates Weak abduction to about 60 degrees is possible through scapular movement, but there is no true gleno-humeral abduction The more the patient struggles to elevate the limb the more he shrugs his shoulder

Since the deltoid is felt strongly contracting the loss of active abduction cannot be due to circumflex palsy, and since passive movement of the shoulder by the examiner is normal, or at least is possible through a further 30 or 40 degrees, the limitation cannot be due to adhesion formation or arthritis The wince of pain at 90 or 100 degrees abduction as the limb is raised or lowered passively and the tenderness on pressure over the insertion of the supraspinatus clinch the diagnosis

As with any other tendon rupture, if the torn fibres are approximated and immobilized with unfailing constancy satisfactory repair will usually take place Operative treatment is not as inevitable as many recent writers suggest The arm is immobilized in 90 degrees abduction and 60 degrees external rotation in a frame applied very carefully so that the arm cannot ever be lowered below the right angle At least ten or a dozen wide bandages must be used to fix the frame to the trunk and to prevent it sliding down The position is maintained rigorously

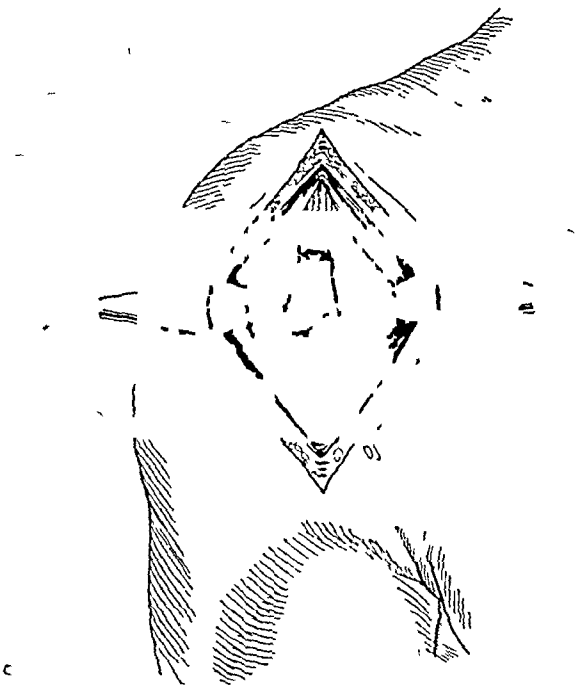

FIG 3.—Complete rupture of supraspinatus tendon and the capsule The articular cartilage of the humerus and the biceps tendon are visible through the rent

for at least eight to ten weeks and until the arm can be raised actively and held 20 or 30 degrees above the right angle Throughout this time active exercises are practised for the fingers and wrist- and elbow-joints

Conservative treatment cannot be really successful unless it is instituted promptly within a few days of the rupture If there has been delay in establishing the diagnosis, or if there is doubt whether the frame treatment will be carried out with absolute efficiency, operation is to be preferred Fairly satisfactory results are possible even many months after injury Through an anterior split deltoid incision the triangular-shaped rent in the tendinous expansion and capsule is exposed, with the articular surface of the head of the humerus visible through it (Fig 3) The apex of the triangle is the

retracted supraspinatus tendon the base is the great tuberosity from which it has been avulsed The humerus is moderately abducted to approximate the torn fibres and several mattress sutures of No 6 chromic gut are employed A ' bone needle should be used and the stitches passed through the tuberosity itself, so that cutting out from the short distal fibres is avoided An abduction frame is worn to prevent early strain on the sutures and is retained for several weeks, until the patient can easily lift the arm and hold it 20 or 30 degrees above the right angle If in addition to the tendinous rupture there is adhesion formation limiting the terminal degrees of abduction, this movement must be regained by the patient s own active exercises, repeated many times during the day

Incomplete Rupture of Supraspinatus

Between the case of simple supraspinatus tendinitis and that of complete rupture of the tendon there is a whole range of cases of varying degree of incomplete rupture of the tendon fibres These are the cases which may present difficulty in diagnosis and treatment Although common they are more often overlooked than diagnosed and there is no doubt that the victim s suffering has frequently been increased by an unjust charge of malingering Evidence of incomplete rupture may be found during routine necropsies in no less than 30 per cent of all cadavers Radiographic examination is negative and the clinical features are all important

There is pain over the shoulder, often referred along the circumflex nerve to the region of the insertion of the deltoid this is increased by active use Tenderness is localized to the insertion of the tendon at the great tuberosity Active abduction is probably possible through a normal range but there is the characteristic catch of pain at 90 or 100 degrees as the torn fibres pass the acromion The movement cannot be sustained against resistance As the rupture becomes more complete active abduction becomes increasingly difficult It may only be possible to abduct the humerus if it is first *fully* externally rotated There is a characteristic reversal of scapulo-humeral rhythm Whereas normally the first half of abduction movement is mainly a movement of the humerus on the scapula and the movement of the scapula on the chest-wall is most pronounced during the second half of the range in the case of incomplete rupture of the supraspinatus the movement is initiated by rotation of the scapula and humero scapular movement is most pronounced in the second half of the range

Conservative measures should usually be given a trial The shoulder is immobilized in abduction and external rotation The frame is retained and no single downward movement of the limb is permitted until full power of abduction is restored and the painful catch at 90 or 100 degrees abduction is relieved This may necessitate fixation for only three or four weeks or in more severe cases for several months If there is no sign of real improvement after six or eight weeks the tendon should be exposed and repaired

If at operation there is no evidence of rupture of the supraspinatus the humerus should be fully rotated inwards and outwards so that the whole of the front outer aspect of the capsule and of the subdeltoid bursa is explored Occasionally thickened hyperaemic fringes are found within the bursa which have accounted for creaking on shoulder movement and because they are nipped between the head of the humerus and the acromion for all of the symptoms and signs of incomplete rupture of the supraspinatus tendon Although subdeltoid bursitis has been a common diagnosis in past years it is actually extremely rare The symptoms are relieved by excision of the thickened fringes and bursal wall followed by regular active exercises and physiotherapy Very exceptionally it is found that there is neither rupture of the tendon nor calcification of the tendon nor subdeltoid bursitis The symptoms have been due to resistant supraspinatus tendinitis without rupture The tendon should be lightly scarified to assist in the revascularization necessary for the relief of symptoms after operation physiotherapy and electrotherapy are employed

Periarthritis of the Shoulder

The symptoms arise spontaneously or after a trivial twist or strain Pain is diffuse and tenderness is not confined to the tuberosity or region of the supraspinatus Movements of the shoulder are guarded by muscle spasm but there is no complete limitation of all scapulo humeral movement such as occurs in tuberculous arthritis It is particularly abduction and external rotation which are limited internal rotation and forward and backward flexion are free The limitation of movement by muscle guard rapidly passes to limitation by adhesion formation varying from a few localized bands to diffuse generalized adhesion of the whole of the capsule— the frozen shoulder

In the early acute stage the worst treatment is manipulation under anaesthesia or frequent passive and forcible stretching by a masseuse Forcible treatment tears the already inflamed tissues and increases the sero fibrinous exudation It the range is actually measured and recorded it is found always to have been reduced by such measures On the other hand the patient must be urged to practise active exercises Massage physiotherapy and hydrotherapy may help the patient to persevere despite discomfort but the one essential treatment is active exercises performed for a few minutes hourly throughout the day The resistance of gravity may be avoided by practising exercises in recumbency and in the stooping position

Periarticular Adhesion Formation

The adhesions may follow periarthritis or a simple strain or contusion of the shoulder or they may arise insidiously when a fracture of the elbow forearm or wrist is treated with the whole limb in a sling Abduction and external rotation movements are limited It is the limitation of external rotation which is of significance The normal shoulder cannot be abducted beyond the right angle if the humerus is held internally rotated and until external rotation movement is regained abduction cannot be regained The range of rotation is tested with the elbow to the side and the forearm and hand pointing forwards Normally it is possible to rotate the limb out through almost 90 degrees so that the forearm and hand now point sideways If this is completely limited it is a waste of time to practise abduction exercises The patient should stand with his back to a wall with his elbows touching it and turn the forearms further and further out until the hands reach the wall He must try to reach the back of his neck and with the fingers clasped move the elbows back into the position of true abduction As external rotation improves he reaches over the top of his head to the opposite ear He may then practise crawling up a wall with his finger tips marking the level reached and trying to attain a higher level every day

The exercises are repeated ten minutes hourly throughout the day There must be encouragement and

tion, but no passive stretching no sudden jerking or forcible movements, and no hanging by the affected arm from overhead beams or bars Manipulation under anaesthesia should not be used except as the last line of treatment, to be applied only when actual measurements show that movement is no longer increasing If a manipulation is unfortunately inevitable, it must be performed as gently as possible and not more than one group of adhesions must be broken at a time If too much is done the reaction is so severe that the movement cannot be retained, and the joint may become stiffer Many shoulders, temporarily stiff after dislocations and minor injuries, have been made permanently stiff by injudicious manipulations, performed too early, repeated too often, and followed by passive and forcible stretching

THE RED CROSS CONFERENCE

CONCLUDING SESSIONS

After the opening proceedings recorded in the last issue (p 1381) the International Red Cross Conference divided itself into four Commissions, which met at the British Medical Association House for sessions lasting for three days At the ensuing plenary session, which was held at St James s Palace on June 24, reports from the Commissions were presented

The first Commission of which Miss Norah Hill (Indian Red Cross) was rapporteur, brought forward a series of resolutions dealing with organization, all of which were passed unanimously by the Conference with one exception —namely, a resolution asking that the needs of the two international bodies, the International Red Cross Committee and the League of Red Cross Societies, should be studied with a view to suggesting the best procedure for raising the funds necessary to meet as far as possible the needs of both bodies The German Red Cross asked that its abstention might be recorded for reasons presumably given in private to the Commission Another resolution which was only carried by a majority in the Commission but unanimously in the Conference declared that no Red Cross delegation, section or committee should be established in foreign territory without the consent of the central committee of the national society of the country concerned, and that such consent should only be asked for in exceptional circumstances, for purposes definitely determined in advance, and for a limited period

Zones of Immunity

After two hours discussion on the form of a resolution it was agreed unanimously, on the motion of Mr Norman Davis, to appeal in the name of humanity to the competent authorities in all countries to prevent or so restrict bombing from the air as to safeguard the lives of helpless women and children and aged civilians and to urge those authorities in all areas where civilian lives are liable to be endangered by any military operations to arrange for the evacuation of women and children into zones of immunity under Red Cross protection This was the unanimous resolution of the fifty-four National Red Cross Societies assembled at the Conference, and was endorsed by the Conference also unanimously at the plenary session

The second Commission which was entrusted with legal considerations, and was reported upon by M Gorge (Switzerland) also brought forward a resolution on the subject of the creation of hospital towns and areas After thanking the committee of the International Congresses of Military Medicine and Pharmacy for the assistance it had given the Commission considered that in any case the creation of hospital towns or areas could not in any way weaken the protection resulting from the rules of international law as a whole and urged the convocation in the near future of a commission of military and legal experts with a view to establishing a draft on the subject for the consideration of a diplomatic conference In the meanwhile it hoped that the Governments would consider as need arose the possibility of concluding mutual agreements providing for hospital towns and areas This was agreed to unanimously by the main conference Another resolution pointed to the satisfactory results obtained during a recent conflict by the creation of an area of immunity for the civil population, and requested the International Committee to bring these satisfactory results to the attention of the Governments concerned at all times when such action might seem expedient Other resolutions related to the protection of women and children against the suffering resulting from armed conflicts, and the role and activity of the Red Cross in civil war

First-aid-Posts on Highways

One resolution of the third Commission, reported on by Dr de Carvalho (Brazilian Red Cross) urged that every effort be made to develop collaboration with automobile clubs and other national and international organizations with a view to providing highways and, more especially, the international trunk roads with standardized types of first-aid posts, the position of which may be shown by standardized road signs It also recommended to the secretariat of the League of Red Cross Societies that the development of first-aid services on highways on a standardized plan should continue to be encouraged and the scope of its activities in the prevention of accidents be widened, in the first place by teaching the rules of the road and first aid to children through the junior Red Cross This Commission also noted the great progress made in the use of aviation to bring relief in cases of disaster to establish communication with isolated populations, to bring supplies of food and medicine to further the transport of doctors, nurses, and relief personnel and to evacuate the sick and wounded It asked that the national societies should attempt to organize courses of training in aerial transport, and that the use of aviation for relief purposes be encouraged

The fourth Commission the work of which was reported by Miss Mabel Boardman (American Red Cross), dealt principally with the educational work of the Red Cross One of its resolutions congratulated the American Red Cross on the splendid organization of its voluntary aids, and recommended that all Red Cross Societies should extend their activity in this field both as a particularly beneficial means of action and as a means of spreading the Red Cross spirit throughout the community

The Next International Conference

It was decided that the next International Conference should be held at Stockholm in 1942 The following were elected a committee to act in the interval between international conferences

Sir Arthur Stanley (British Red Cross Society)
General A Hultkrantz (Swedish Red Cross)
Senator G de Michelis (Italian Red Cross)
Chao Phya Bijayanati (Siamese Red Cross)
Dr Pedro T Vignau (Argentine Red Cross)

A large number of complimentary speeches were made by members of the Siamese, Polish, Japanese, Chilian French and Egyptian delegations among others, and special thanks were accorded to the British Red Cross Society for acting as host A representative of Nationalist Spain congratulated the chairman (Sir Arthur Stanley) on the manner in which he had kept the Conference away from political questions Senator de Michelis (Italian Red Cross) made a long statement on Italian law which, he said, provided for the creation of safety zones for medical services and shelter for the civil population also for prisoners of war to be dealt with according to international regulation even in the case of a country which had not honoured the international Convention

In the course of the week a reception was given by H M Government at Lancaster House another by the Lord Mayor at the Guildhall and an afternoon party at Buckingham Palace The closing event was a thanksgiving service at St Paul s, when the Archbishop of Canterbury gave the address H R H the Princess Royal Commandant-in-Chief British Red Cross Society was present with parties of V A D members representing every country branch in England and Wales and Scotland The Red Cross Colour was escorted by a representative company of commandants and was laid on the altar during the service and afterwards taken to the Chapel of St Michael and St George The Lord Mayor and Sheriffs also attended the service In the course of his sermon the Archbishop said that if he were to choose a motto for the Red Cross movement not only to describe but to inspire its work it would be the injunction of the apostle Honour all men It stood for the honour of humanity

ANTI-EPIDEMIC WORK IN CHINA

The Council of the League of Nations some years ago concluded an agreement with the Chinese Government by which the League technical organizations (health, *transit and communications economic and financial)* could be used to help forward its policies of national reconstruction Political and administrative responsibility of course rested with the Chinese Government in the vast enterprise of trying to reconstruct one quarter of humanity and modernize a 4 000-year-old civilization But under the plan of technical co operation Chinese civil servants, engineers doctors educationists and technicians have been able to gain experience and pursue studies abroad useful for their work Side by side with this the League has put at the disposal of the Chinese Government the services of foreign experts either for consultation in regard to some particular piece of reconstructive work *or for a period of years, to give technical advice for the* framing and application of some long range policy such as road building modernizing silk cultivation, organizing agricultural co operation, and establishing the nucleus of a public health service

Effect of War

With the beginning of the Japanese invasion the Chinese Government s national effort was switched over to putting and *maintaining China on a war footing From the outset of the* military operations one of the most pressing problems was the care of refugees and the danger of epidemics The National Health Ministry and the Central Field Health Station at Nanking were wrecked by air bombing at the beginning of the war China s scanty resources in medical personnel and equipment were strained to the utmost by the needs of the Army At the same time the invasion of large areas of China and the devastation of numerous cities and villages set up great movements of population Immense numbers of refugees destitute and fleeing for their lives became an urgent and grave problem for the Chinese Government, and even for neighbouring territories not least from the point of view of public health

In September last the Chinese Government drew the attention of the Council of the League to this situation and to the resulting danger of widespread epidemics It requested that the plan of technical co-operation between China and the League should be adapted to this situation by concentrating primarily upon co-operation with the National Government and the provincial administrations in the prevention and control of epidemics and the general relief of the civilian population and refugees The Assembly voted 2 000 000 Swiss francs for technical co operation with the Chinese Government in carrying out an anti epidemic campaign Acting on instructions from the Council a special subcommittee of the Health Committee met in October to frame a plan of action

The Health Committee s Plan

At this meeting the Chinese representative Dr Hoo Chi tsai said that the Chinese Government confining its requests within the financial and technical limits of the Assembly resolution asked the Health Organization to make a special effort in five areas preferably in the provinces of Shensi Hupei Kiangsu Kiangsi and Kwang Tung He asked that anti epidemic units should be sent to the areas without delay Each unit should consist of a foreign epidemic commissioner *a foreign bacteriologist* a foreign sanitary engineer an isolation hospital with a foreign doctor a car two ambulances and ten light lorries These units would operate under the orders of the Chinese authorities Dr Hoo emphasized the urgent need for rapid action As a result of the war hundreds of thousands of refugees were streaming inland The distress and the danger of widespread epidemics were great Medical stocks were running low Available supplies from all sources would last barely three months All available health personnel had been mobilized, but there was a shortage of experienced surgeons

The subcommittee had before it a survey of the epidemic situation the probable effects of military operations and the movements of refugees with special reference to the danger of widespread epidemics of plague typhus small pox enteric fever and other infectious diseases The plan adopted was *based on previous experience adapted to suit the special conditions* In view of the financial and technical limitations imposed by the Assembly and Council resolution it was decided that the work must be limited as regards geographical area and methods though not strictly limited to one region The Chinese authorities themselves would assume responsibility for the work being carried out

The technical plan had as its one object the reinforcement of the collaboration already existing in view of the exceptional circumstances of the hour in other words to advise and support the competent Chinese technical services The subcommittee decided to constitute three mobile medical units and to assign an area of action to each These units in *addition to their own resource* would draw upon a central supply of sanitary and medical material This enabled them to secure additional supplies for organizing on the spot the means for the isolation and observation of the sick In this way it was believed a general organization could be set up that would be elastic and mobile in action and around which the Chinese health authorities could in agreement with the units concentrate their own medical and health services as well as any units that might be sent from abroad (Red Cross etc) The whole organization could then work on the basis of a considered plan adapted to the area and to current necessities and concern itself not only with preventive measures but also with combating epidemics that had already started

The League Epidemic Commission

The three medical units—the first under Dr Mooser (Swiss) the second under Dr R C Robertson (British) and the third under Dr (Inspecteur General) Lasnet (French)—arrived in Hong Kong early in January The Epidemic Commission consists of the three *Commissioners together with a repre*sentative of the Chinese Government and Dr Borcic (Yugoslavia) the League of Nations Technical Adviser on public health questions to the Chinese Government

Subsequently the epidemic position in China was discussed The future location of the League units was decided upon and the laboratory and other medical facilities already existing in the areas covered transport budgetary question and details of the liaison to be established with the Chinese Government were all considered No 1 Unit went by rail through Hunan to *Sian Fu capital of Shensi* No 2 Unit to Changsha capital of Hunan and No 3 Unit to Nanning capital of Kwangsi and to Canton Early in February all three units had reached their station established headquarters and were engaged in making official contacts In each case the League unit s Chinese medical and auxiliary staff was incorporated in the local health administration and at the same time carried

close touch with the Central Government through a special Chinese liaison officer In this collaboration every effort has been made to meet present emergencies and also to strengthen and where necessary establish permanent health work particularly in rural districts It is hoped that the present League assistance to China will not simply be of a temporary nature but will serve to continue the medical assistance given prior to hostilities and thus be a permanent contribution to China's welfare

An account of what has been attempted and done in certain areas by the emergency health services appeared in the *British Medical Journal* of June 4 (p 1222)

GUY'S HOSPITAL

OPENING OF NEW PATHOLOGICAL BLOCK

The new Pathological Building of the Medical School of Guy's Hospital was opened on June 23 by the Earl of Athlone, Chancellor of the University of London It is a handsome building of eight floors, housing in addition to pathology, the departments of bacteriology, clinical chemistry, pharmacology and physics To bring about these improvements the School has expended the very large sum of over £85 000 Of this sum it has provided £35,000 out of its own income, £30,000 has been borrowed on easy terms from a friend of the hospital, and £10 000 has been made available by the munificence of the University

The Chancellor was received by the Vice-Chancellor, Sir Robert Pickard, Viscount Goschen, president of the hospital, Viscount Nuffield treasurer, and Mr T J Evans, dean Certain of the governors and medical staff were presented, and a procession was formed to the physiological lecture theatre, where the formal proceedings took place After Lord Nuffield had welcomed the Chancellor, the Dean gave an address in the course of which he said that the School felt that by coming to open this latest extension Lord Athlone was giving his commendation to its attempt to increase the teaching and research strength of the great university of which he was the head

A Teaching Hospital's Great Effort

The teaching hospitals of London (the Dean continued) had grown out of small beginnings, within houses built for the care and cure of a neighbouring population, but they had become the training ground for the medical service of a whole nation To day the small hospital founded by Thomas Guy in 1725 had sons in every corner of the Empire Unhappily now the very existence of teaching hospitals was in imminent danger It was one of the queerest anomalies of British civilization that the training of the most important and devoted of its public services should be hampered at every stage by being committed to an existence of perpetual mendicancy Guy's had accomplished an effort not only to bring to higher efficiency the mechanism for training physicians and surgeons, but also to provide more modern and abundant facilities for skilled researchers into the cause, control, and cure of disease When, in 1923, the present superintendent of the hospital welcomed the then Prince of Wales at an opening ceremony he stated that the occasion marked the completion of a scheme of rebuilding of the medical school In the preceding twenty-five years the School had spent £100 000 on rebuilding Now, after another fourteen years it had again grown dissatisfied and had made a valiant effort to provide itself with an institute of pathology as spacious and up to date as any in the kingdom

Advantages of Concentration

The Chancellor of the University began by recalling the famous names of Bright Hodgkin Wilks and others founders of the great tradition in scientific medicine which the hospital so worthily maintained The University viewed with great satisfaction every effort made by its constituent schools to provide themselves with buildings adequate to the needs of students and teachers It was specially proud of the strength and size of its faculty of medicine Its schools trained nearly half the medical students of Great Britain He congratulated Guy's on concentrating all the departments of the school on one site thereby obtaining that close co operation between departments which was necessary for the best work He was also glad to learn that special accommodation had been provided for the Guy's Hospital Research Fellow and for the Clinical Research Unit of the Medical Research Council The establishment of such research units was the sign of a new age in the scientific study of human disease The University recognized with appreciation that the new building had been financed mainly from the ordinary funds of the school without public appeal, though with some assistance from the Court of the University He hoped that the example of famous benefactors of the past would be followed in the future

School and Hospital

The medical school and the hospital (Lord Athlone continued) were inseparably wedded A medical school without a hospital was useless and impotent The association of a school with a hospital at once placed the hospital in a higher category Not only did it then attract teachers of the highest standing but the presence of a body of students ensured that the teachers, stimulated by constant criticism and observation, gave of their best to both the science and the art of medicine The reputation of the hospital depended on its school and the reputation of the school depended on the financial stability and efficiency of the hospital For the full fruition of the partnership it was therefore essential that both hospital and school should be efficient, progressive, and equipped to the highest standards The charitable public perhaps did not always quite appreciate the exceptional claims of the teaching hospitals Their work went far beyond the mere local treatment of patients They were the training grounds of the medical profession, the homes of research, and the pioneers in benefactions not only to their own patients but to humanity at large

The Chancellor then declared the new building open The chairman of the School council Mr W M Mollison in proposing a vote of thanks, said that for the last six years Lord Athlone had been Chancellor of the University and he was convinced that no university had a more active and hard-working head He devoted a great deal of his time and energies to the interests of the University and was familiar with the medical schools

VICTOR HORSLEY MEMORIAL LECTURE

The Victor Horsley Memorial Fund, which was raised in 1920 to commemorate the services of Sir Victor Horsley to Science and the Empire, is devoted to the giving of a lecture triennially in London entitled the "Victor Horsley Memorial Lecture' By invitation of the Trustees (the Presidents for the time being of the Royal Society, the Royal College of Surgeons of England, and the British Medical Association, the senior physician of the National Hospital for the Paralysed and Epileptic, Queen Square, the senior surgeon of University College Hospital, and Mr Stanley G Robinson, son in-law of Sir Victor Horsley) the sixth lecture will be delivered by Dr Gordon Holmes, C M G, C B E, F R S, F R C P, Physician, National Hospital for Nervous Diseases and Charing Cross Hospital, in the Lecture Theatre of University College Hospital Medical School, Gower Street, W C on Tuesday, July 12, at 5 p m The title of the lecture is "The Cerebral Integration of the Ocular Movements and the chair will be taken by Sir Cuthbert Wallace Bt K C M G, C B, D Sc, D C L, President of the Royal College of Surgeons Admission to the lecture is free on presentation of a visiting card and tea will be served in the Library of the Medical School at 4 30 p m

INTERNATIONAL SOCIETY OF SURGERY

Revised Plans for Congress

For some reason which has not yet been explained the German authorities have cancelled the congress which had been fixed to take place in Vienna from September 19 to 22 and was announced in the *Journal* of June 4 (p 1219)

In order that the material prepared for the discussions which had already been arranged may not be wasted and to diminish disappointment the executive are making plans to hold a congress in Brussels on the same dates Particulars will be circulated to members as soon as possible Travel arrangements will be made by Messrs Thos Cook and Sons

INDIA

Tuberculosis A Key Problem of India

A lecture under the auspices of the Over seas League and the East India Association was given at Over Seas House, London on June 21 by Major General Sir John Megaw, President India Office Medical Board and Medical Adviser to the Secretary of State The chair was taken by the Marchioness of Linlithgow Vice-Reine of India Sir John Megaw whose subject was 'Tuberculosis in India,' said that nobody could tell, even approximately what was the death rate from tuberculosis in India as a whole or describe the geographical distribution of the disease, or say to what extent it was increasing In the cities and large towns the deaths from tuberculosis were recorded in Cawnpore the latest figure was 4 600 per million of population or much the same as it was in England one hundred years ago in Calcutta it was 2 500 and in Bombay 2,000 These rates probably erred greatly on the side of optimism since many deaths from tuberculosis were returned under the headings of fevers or other respiratory diseases The death rate from tuberculosis among girls and young women who lived in purdah in the large centres of population was appalling being several times higher than that of males of the same age group

INCREASING INCIDENCE OF TUBERCULOSIS

Medical men in India, Sir John Megaw continued were almost unanimous in declaring that the disease was increasing rapidly, and was extending to rural areas formerly free from infection also that when the disease spread to new localities it assumed a more virulent form than in places previously affected A few years ago he had attempted to make a rough and ready survey of the number of cases of tuberculosis and other diseases in the rural areas of India His method was to issue a questionary to a large number of doctors in charge of dispensaries in typical agricultural villages An estimate based on their replies suggested that there were 1½ to 2 million cases in India though not even a moderate degree of accuracy was claimed for this estimate An examination had also been made of the statistics published every year on the health of prisoners From these it appeared that in 1935 the admission rate for tuberculosis of the lung in prisons was 5 per mille as compared with 9·5 forty years ago Not much encouragement was to be derived from this slight reduction for over the same period the general health of prisoners had improved in a striking manner as shown by the fall in the total death rate to between one half and one third of what it was in 1895 During the same period of forty years the number of cases of tuberculosis of the lung in Indian soldiers fell from 2·3 per mille to 1·9 this small reduction again contrasting sharply with a fall in the death rate from all diseases in Indian troops from 11·6 to 2·15 and with the fall in the tuberculosis case rate of British soldiers in India during the same period from 4·8 to 1 per mille

MEASURES FOR PREVENTION

The spread of infection in India could only be prevented by a process of educational persuasion The people must be taught how droplet and alimentary infections were conveyed and how they could be avoided It was important not to lay undue emphasis on the horrific aspects of the disease There was much to be said for directing propaganda against all infectious diseases of the respiratory and alimentary systems rather than against tuberculosis alone Suitable accommodation in a verandah or open lean to could be provided for a patient at trifling cost at any rate in rural areas and a member of the patient's family could be trained to look after him From ten to twenty patients could be treated in their own homes for the cost of a single patient in a modern sanatorium The first essential in preventive measures was to have a sound plan this demanded the co operation of men with practical knowledge of agriculture industry economics hygiene education and above all, of men with a sympathetic understanding of the psychology of the Indian peasant There were encouraging signs that those responsible for the welfare of India realized the nature and gravity of the problem and the responsibility of the Government for initiating action On the subject of medical relief Sir John Megaw added that in India there were very special reasons for supplying medical aid to the victims of the disease the chief being that before any preventive action could have a hope of success the good will of the people must be enlisted by the cure of disease Tuberculosis was a key problem of India and its solution would mean far more than the conquest of one terrible malady He specially praised the efforts made by Lady Linlithgow for the relief of suffering

Population of the Punjab

The continuing increase in the population of the Punjab is giving rise to considerable disquiet Serious economic and public health problems will have to be faced unless the birth rate soon begins to fall In his annual report for 1936 Lieutenant-Colonel C M Nicol Director of Public Health states that for the last five years there has been an average yearly increase in population of 419 275 a figure which is almost certainly an under-estimate of the actual position since in 1926 the figure was 5,68 8— representing a natural increase per 1 000 of population of 21·46 calculated on the estimated population for 1935 this rate of increase is much higher than the corresponding rate for any other Province in India While the birth rate per 1 000 is 43 the highest or record the corresponding death rate is 22 the lowest figure yet recorded It cannot be determined yet whether this state of things is a matter for congratulation or for alarm or how the future will develop since the factors which make for increase in the population are not constant and the estimates of food production probably are too low it is clear however that careful consideration of the whole position is now urgently necessary Wheat rice and maize are the staple foodstuffs in the Punjab and all the crops have increased vast new areas are being brought under cultivation thanks to the extension of irrigation Unfortunately however there is already evidence of physical deterioration of the rising generation in the Province as shown by the examinations of school children and of recruits for the Army Of the total deaths in the Punjab in 1926 30·97 per cent occurred in infants under 1 year 17·1 in children aged between 1 and 5 and 5·43 in children between the ages of 5 and 10—that is to say 53·5 per cent of the total deaths in the Province occurred in persons under 10 years The infantile mortality rate for the year under review was 198·44, slightly higher than the figure for

1935, but well below the average for the last ten years Colonel Nicol remarks that it might be argued that there cannot be a great deal wrong with a community which can show in comparison with past years a record low death rate and high birth rate, a larger annual increase in population than has ever been known previously, and a reduction in the incidence of plague sufficient to suggest that the disease is dying out Yet it still remains true that the odds against any individual born ever reaching the adult state are high, and the damage done by non-fatal illness to the youth of the Province is painfully clear though in these respects there has been an obvious improvement during the last few years

ENGLAND AND WALES

Specialist Services for Bristol Corporation Hospitals

At a meeting of the Bristol City Council on June 14 a scheme was approved whereby teams of specialists in medicine and surgery will be available for the hospitals under the control of the Health Committee The scheme is based upon the fact that Southmead Hospital a corporation institution, is now carrying out work of a standard equal to that of the voluntary hospitals, and it is desired to ensure for it the necessary specialist services As a result of discussions with the Professor of Clinical Medicine and the Professor of Surgery of the University of Bristol (who will be responsible respectively for the medical and the surgical services under the new arrangements) and the committees of the Bristol Royal Infirmary and the General Hospital, the corporation for a fixed yearly payment will be able to call upon the services of the teams The specialist medical service will be provided by three visiting physicians or teams of physicians, who will have entire charge of the medical cases, and so far as the surgical work is concerned there will be four teams, each consisting of two surgeons The whole of the specialist staff will meet regularly to discuss the progress of development at Southmead, and any recommendations from these meetings will be forwarded by the medical superintendent (the convener) to the medical officer of health for submission to the Health Committee Nothing in the scheme is to interfere with the internal administration of Southmead or any of the hospitals of the corporation this remains the medical superintendent's responsibility No hard-and-fast lines are to be laid down with regard to cases admitted to the voluntary or the corporation hospitals In general, as at present the acute cases and emergencies will be admitted to the Royal Infirmary and the General Hospital, while cases requiring more prolonged treatment will go to Southmead from the first but no patient is to be kept waiting if a bed is available at any of these three institutions, and if a patient expresses a strong wish to enter any particular institution this is to be taken into account The payment for these services subject to annual review, has been fixed at £900 for the medical services and £900 for the surgical These payments will meet all the medical and surgical specialist services which the corporation may require with the exception of attendance in court in connexion with workmen's compensation or other litigation It has also been agreed that a physician or team of physicians and a surgeon or team of surgeons shall attend at Southmead each day and that each team shall attend at least twice a week After some experience of the arrangements it will be necessary to appoint house-physicians and house surgeons but at present the number and cost of such appointments cannot be stated As this is an enlargement of the specialist services of the corporation it does not affect physicians or surgeons with existing contracts except the consultant physician for heart cases and the consultant surgeon at Southmead both of whom will be included in the teams of specialists Before the proposals were adopted by the city council the remark was made by a member that much remained to be done before Southmead Hospital became what it ought to be, and that there was a great shortage of hospital beds in Bristol

Institute of Child Psychology

The new premises of the Children's Centre, the Institute of Child Psychology, at 6, Pembridge Villas, W11 were opened on June 23 by the Marchioness of Carisbrooke who expressed herself as being delighted with the building and equipment and took special interest in the play therapy rooms particularly in those rooms where children could play with water and messy materials to their hearts content Professor Winifred Cullis chairman of the Management Committee pleaded for financial support for the work, which she had watched with interest for several years and of which she fully approved Mr Kenneth Lindsay Parliamentary Secretary to the Board of Education said that official education was coming to recognize and be interested in the fact that there were different kinds of children for whom special provision must be made He instanced the special categories already provided for, and looked forward to the moment when provision could be made for nervous and neurotic children to receive such help as they needed He heartily endorsed the work of the Institute of Child Psychology Dr Margaret Lowenfeld in giving the history of the Institute, laid stress on that aspect of its design which emphasized the importance of having a children's centre to which mothers could bring all the children they were troubled about and where a differential diagnosis could be carried out by experts Educationists who came to know the methods of treatment and the results were almost unanimous in their approval The varying activities of the Institute and its relationship to other agencies were touched upon by Dr Ethel Dukes who also spoke of the environmental influences activating the many difficulties from which the children suffered Dr Hazel Chodak Gregory, vice chairman, proposed a vote of thanks to the Marchioness of Carisbrooke for her kindly interest in the work of the Institute Altogether about 300 people inspected premises during the period that the committee the directors, and the staff were "At Home to those who had been invited to the opening ceremony

Research Grant to Maudsley Hospital

The Rockefeller Foundation of New York has offered a grant of £25,000 during a period of five years from July 1 towards the support of psychiatric research at Maudsley Hospital subject to a condition that the amount of grant during any one year shall not exceed £5 000 This grant follows another from the same source of £9 000 in 1935 The offer has been accepted, and an expression of the London County Council's appreciation of the generous gift has been sent to the donors The manner in which the grant shall be spent is under consideration

House Appointments at London County Hospitals

A regulation of the London County Council prescribes that the period of engagement of house-physicians and house surgeons in the hospitals service shall be limited to six months but provided that not more than twelve months are spent at one hospital the engagement may be extended for further periods of six months up to two years when employment ceases unless promotion has been secured It is proposed to vary this condition to provide that a house physician or house surgeon may be employed at one hospital for not exceeding two years on the understanding that he shall not be employed on work of the same type for more than twelve months It is considered that such variation would conform in spirit with the principle that medical practitioners at the outset of their career should not be employed for more than limited periods in any one type of work and the limitations should be based on duties rather than on change of hospital

Reports of Societies

OESTRADIOL BENZOATE TREATMENT OF SENILE VAGINITIS

At a meeting of the Edinburgh Obstetrical Society on *May 11* with the president Professor JAMES HENDRY in the chair Dr T N MACGREGOR read a paper on oestradiol benzoate therapy in senile vaginitis

Dr MacGregor's communication recorded a clinical and photographic study of fifteen cases of senile vaginitis which was described as an inflammatory condition of the vagina characteristically associated with post menopausal life All the patients had had a normal or artificial menopause the symptoms complained of in order of frequency were vulval irritation and vaginal discomfort vaginal bleeding dysuria leucorrhoeal discharge and dyspareunia The diagnosis was based on examination of the vulva and vagina directly and by the speculum the characteristic features were redness round the vaginal introitus areas of petechial haemorrhage scattered over the vagina, and narrowing of the vaginal vault Uterine carcinoma was excluded by curettage when there was a history of bleeding

Results of Treatment

As a result of therapy eight patients were completely cured and had remained symptom free for periods varying from fourteen to twenty one months Seven were relieved in that they were almost symptom free but there was still evidence of some inflammation of these one was a diabetic and two had an associated leukoplakic condition of the vulva The rationale of oestradiol benzoate therapy in senile vaginitis was the restoration of the atrophic vaginal epithelium to that condition which existed during the period of reproductive life The reconstitution of the vaginal epithelium by the oestrogens not only increased the vascularity of the tissue and thus promoted healing but the increase in the cellular structure subjacent to the denuded areas caused shedding of the infected tissue Oestrogenic therapy also stimulated the production and deposition in the vaginal epithelium of nutritive substances necessary for a normal vaginal flora which once re established proved inimical to the invading organisms Cessation of therapy was followed after a time interval by a reversion of the vaginal epithelium to the atrophic condition which normally existed after the menopause The main form of treatment given was the intramuscular injection of oestradiol benzoate supplemented in two cases by vitamin A The dosage varied from 5 mg bi-weekly to 10 mg daily according to the severity of the condition and the response obtained Intramuscular injection was the most successful mode of administration Oestradiol in the form of suppositories though conceivably a practical way of treating this condition had proved disappointing probably on account of the atrophic state of the vagina which would have militated against the absorption of the oestrogens This form of treatment might however constitute a useful adjunct to therapy after the vaginal epithelium had been rejuvenated by intramuscular administration of the oestradiol benzoate

The eighth International Congress for the Study of Accidents and Occupational Diseases will be held at Frankfort from September 26 to 30 under the presidency of Professor Marteneck Professor Magnus will be chairman of the Section for the Study of Accidents and Professor Koelsch of the Section for Occupational Diseases Further information can be obtained from Ministerialrat Dr Bauer Unter den Linden 1 Berlin 8

Correspondence

Treatment of Pneumonia

SIR—May I be permitted to make some comment on the valuable leading article in the *Journal* of June 25 (p 1371) I have made some investigations into the action of 2(*p*-aminobenzenesulphonamido) pyridine known shortly as T693 and from these experiments I have come to the conclusion that chemotherapy and immunotherapy in pneumococcal infections are not competitive but complementary I have found that T693 is incapable of killing any pneumococci in human blood from which the leucocytes have been removed every pneumococcus implanted will grow out but there is a certain retardation of growth If however the human blood has its full complement of leucocytes then the presence of T693 in a concentration which ought to be easily attained in the body completely arrests the growth The T693 can retard the growth of the cocci but the natural defences have to do the killing

I have also found that human blood together with T693 and immune serum can deal with a much larger infection than the same blood containing *either* T693 or immune serum This being so the more immune the patient is the better will be the killing of the pneumococci and the ultimate result will depend on whether the patient has sufficient resistance to deal with the pneumococci even after they have been in contact with the drug

For these reasons I suggest that the advent of T693 has made the problem of anti pneumococcal serum of even greater importance In the past serum therapy in pneumonia has suffered from the fact that it has never been possible to make a serum of potency sufficient to ensure with certainty that it would be able to combat a pneumococcal infection, but it would appear that with a combination of T693 and serum the latter is likely to be effective even when the potency of the serum is relatively low It is not difficult to make serums for all the types of pneumococci if one does not aim at very high potency The typing of the pneumococcus is not nowadays a matter of great difficulty nor is it beyond the powers of the younger generation of practitioners to make intravenous injections True it is much easier to prescribe tablets to be taken three or four times a day but from the results I have obtained in the laboratory it seems clear that if the best is to be done for the patient then he should be immunized as well as treated by the drug

Hitherto I have only talked of serum as a means of immunization but we must not forget that it is possible to immunize patients actively by means of vaccines It has been shown that in animals which have received pneumococcal vaccine protective antibodies can be demonstrated within three days and the same thing has been demonstrated in patients suffering from pneumonia This means that the serum of these immunized animals or patients has the power of protecting other animals against otherwise lethal doses of pneumococci and for this to be positive there must be a very considerable degree of immunity present (for the amount of serum in reduced lots to be diluted in the animal's blood) It is reasonable to assume therefore that well within three days the patient who has received vaccine will have responded with an increase of immunity and such increase may well be sufficient to turn the scale when it is aided by a drug like T693

My object in writing this letter is to try to prevent physicians discarding immunological methods entirely in favour of chemotherapy when theoretically it should be so much better to combine the two Pneumonia is a serious disease, and should be treated by all methods which have the effect of increasing the immunity of the patient or which are detrimental to the pneumococcus Hitherto attention has chiefly been given to increasing the patient's immunity, now, however, it seems as if a chemical has been found which is in some way detrimental to the pneumococcus Let us not discard the older methods but supplement them with the new if we are to obtain the best results in the treatment of our patients, which, after all, is our only aim and object—I am, etc,

Inoculation Department, St Mary's Hospital, London, June 27 ALEXANDER FLEMING

The New Chemotherapy

SIR—The objection to the use of sulphur-containing aperients for patients taking sulphanilamide has been stressed recently in the columns of the *Journal* (June 4, p 1236, June 25, p 1392), the reason for the objection being the danger of causing or aggravating the cyanosis due to sulphaemoglobinaemia As the mode of action of the new group of drugs is still so largely a matter of conjecture, it may well be that this fear of sulphaemoglobinaemia is quite misplaced, to say nothing of the chemical difficulty involved in understanding how so stable a substance as, for instance magnesium sulphate can be reduced in the body

Sulphur taken by mouth will diffuse widely, as its excretion through the kidneys, lungs, and skin indicates This property, incidentally, is taken advantage of in some old-fashioned treatments, such as the rectal injection of hydrogen sulphide for phthisis or the eating of onions for acne vulgaris Does the sulphur in the new compounds dissociate easily in the body? The frequent occurrence of sulphaemoglobinaemia suggests that it does, penetrating widely, for it must be remembered that this condition occurs when there is no other possible source of sulphur in diet or drugs Spectroscopic examination of the blood points to its being a common occurrence Perhaps it is an invariable one to some degree, if a sufficient dose is taken and the drug is to be of service so that it is the price that must be paid for effective action It is difficult to understand why so much anxiety has been caused by it Marked cyanosis in patients subsequently making a good recovery must have been seen by all using the new drugs extensively Another toxic sequel has been noted, however, which occasionally leads to a fatal result and is of great theoretical interest—acute agranulocytic anaemia

It is sometimes said that a few years ago the search for a drug with a selective lethal action was regarded by many as a search for a chimera yet such drugs were known and used Benzene (5 to 10 minims) is an official preparation It was used in the treatment of leukaemia and the precaution of counting the white blood cells frequently was taken as its selective poisonous effect on these cells was sometimes very rapid Recently even more specific effects have come to light in a long series of cases of agranulocytic anaemia following the use of amidopyrine a derivative of benzene In these cases the action is principally on the polymorphonuclear leucocytes It is interesting in this connexion to consider the formulae of the new agents There are many of them but so far as I know they are all benzene derivatives with a sulphur-containing group the best known of course being *p* aminobenzenesulphonamide Are we perhaps dealing with a series of which benzene, amidopyrine, and sulphanilamide are members and of which the last, by virtue of its easily dissociated and diffusible sulphur is so modified that it has a specific lethal action on some pathogenic organisms which, after all, can in some respects be compared with the relatively independently existing white blood cells? It is worth pointing out that there is much to suggest that the discovery was an accidental one in the course of a laborious investigation of azo dyes There has been little official information respecting this matter published in this country It would not be the first time that chance has smiled on the Farbenindustrie, and, of course, this would not affect the practical importance of what came to light, but it would certainly help to limit the field of inquiry as to how these drugs work—I am, etc,

London, S W 1, June 27 EDWARD GALLOP

Treatment of Placenta Praevia

SIR—The paper on the treatment of placenta praevia by Drs O Lloyd and J E Giesen (*Journal*, June 11 p 1258) would seem at first sight to show that in hospital practice it is possible to plug the vagina in placenta praevia *without greatly increasing the risk of sepsis for* in their series the morbidity rate was increased by something less than 1 per cent, though the number of cases treated by plugging was more than doubled Probably, however, few who read the article will be convinced that the fall in mortality was due to the plugging It seems much more likely that it is due to the increased use of blood transfusion seeing that in the second series the number of transfusions was thirty-seven, as compared with only ten in the first series

Do the writers really believe that packing the vagina controls haemorrhage from placenta praevia if the membranes are unruptured? One might expect it to do so if the lower uterine segment could be firmly compressed against some unyielding object—usually the foetal head Whatever may be the possibility of doing this if the membranes are ruptured, it is obviously not possible if the foetus is still floating freely in fluid "The condition of the patient was, as a rule, adversely affected by a combination of haemorrhage and *shock resulting from the operation of plugging* (my italics) May it not be that arrest of the haemorrhage was brought about, not by the plugging at all, but by the shock resulting from it? In any case, leaving a pack in the vagina for twenty-four hours or more before performing Caesarean section seems to be inviting trouble sooner or later It will be noticed for example, that of the sixty-five cases plugged in series A the number of morbid cases was twenty-two (33 per cent) Furthermore, of the twenty-two morbid cases in this series no fewer than twenty (91 per cent) had been plugged Of the 121 cases that were treated without plugging only two were morbid (1 6 per cent), and in one of these pyrexia was due to a urinary infection

If the use of blood transfusion in placenta praevia needed any advocacy to day this paper, so excellently and clearly presented, might furnish strong evidence of its value Few, however, will find in it any encouragement to perpetuate the use of the vaginal pack which most obstetricians nowadays believe to be a septic and therefore dangerous appliance—I am etc,

London, W C 1 June 20 F J BROWNE

The Unconscious Mind and Medical Practice

SIR,—The article by Dr Ernest Jones on the unconscious mind and medical practice in the *Journal* of June 25 (p 1354) states the case for a wider application of psychotherapy with an incisive lucidity and a lack of polemic which is as refreshing as it is rare among writers on that specialty. The first reason he gives for the neglect of this all-important side of the healing art is much the most serious. I refer to the difficulty experienced by the general practitioner in obtaining any form of guidance in the technique of this form of therapy. If the parturient woman is in difficulties if the baby suffers from a phimosis or if it later contracts diphtheria and the practitioner needs advice as to the best way of dealing with any of these problems he can find at once in his library full simple and detailed guidance as to the method which he ought to adopt. Certainly he will find that the experts differ as to which treatment is the best in any given case but at all events the technique will be described with such meticulous care that he can at least try out the method of his choice. My examples are of serious conditions which though they might be better treated by a specialist can be and often are, successfully dealt with by the general practitioner.

Now let us take two not uncommon and certainly equally serious functional conditions: impotence in the husband immediately after marriage and functional aphonia in a woman whose living depends on her ability to use her voice. Neither of these is rare and the first is serious enough to lead to suicide. I have read a few text-books and many articles in the journals on psychotherapy but in none of these have I found the instructions which would enable me to set about the treatment of the two cases mentioned. Surely some form of technical guidance capable of being followed by even the dense unconscious ridden mind of the general practitioner can be devised. If the whole body of family practitioners have to wait till they can undergo a period of discipleship in order to learn this art then progress is bound to be very slow indeed. Is there not still hanging about this specialty just a remnant of the dark draperies of the occult which is repellent to that hard core of common sense which has so often saved our profession from the pitfalls of immature doctrines in the past? Something in the nature of a *vade mecum* of psychotherapy for beginners is what one would like to see. We cannot hope to emulate the work of the maestros in the art but the fumblings of our prentice hand might produce results which would inspire us to greater effort and attract attention to and give us a respect for that all powerful but murky basis of our conduct the unconscious.—I am, etc.

Malvern Link, June 27 G. WAUGH SCOTT

Sequelae of War Gas Poisoning

SIR,—In reference to some correspondence that has appeared in the *Journal* in connexion with mortality rates among ex-soldiers particularly those suffering from sequelae to war gas poisoning and the letter which appeared in your issue of April 9 last (p 813) over the signature of Dr W. N. Abbott I raised this matter by question in the House of Commons some weeks ago and your readers may perhaps be interested in a further letter which I have received from Mr H. Ramsbotham Minister of Pensions who has given authority for its publication.

It is evident from the large correspondence I have received on this matter that there are very many cases of serious disability arising from war gas poisoning who have never received any pension from the State and similarly many deaths have been accelerated from the same cause which have never come under the notice of the Ministry.

It seems to be the particular penalty of gas poisoning to show its effects at a much later stage and this has been a real hardship to many an ex-service man in that he could not have made an application for pension at a stage when it could be substantiated by accurate medical certification.—I am, etc.

House of Commons, June 2 HENRY MORRIS JONES

*** The letter of the Minister of Pensions to Sir Henry Morris Jones dated June 1st is as follows:

I have read the items in the *British Medical Journal* issues of the 1st January and 9th April which prompted your supplementary question on 16th May and I am glad of the opportunity it affords me of correcting the erroneous impression which might be formed (as indeed in your own case it would appear to have been) from the statistics in question.

It is true that I said on the Motion for the Christmas adjournment that the mortality rate among pensioners as compared with the civil population was 45 per cent above the civilian population of the same age in this country whereas in the United States the excess was 71 per cent and in South Africa 77 per cent. But these mortality figures referred of course to deaths among all disability pensioners *from all causes and not exclusively to cases of war gas poisoning or respiratory diseases*. Incidentally I may say that the excess death rate for disability pensioners over the average for the population is diminishing. For the year ending 31st March the excess was not more than 38 per cent.

I note the statement over the signature W. N. Abbott in the April issue of the *Journal* but this merely reiterates the above statistics as I gave them and goes on to say: It has been observed in New Zealand that the mortality statistics for respiratory diseases are 30 per cent. above normal in similar groups of ex-soldiers. What this means is not clear. I can only say firstly that we have no statistics of the mortality rate of ex-service men as distinguished from pensioners—indeed I know of no country that has—and secondly that the percentage proportion of deaths from respiratory diseases (including tuberculosis) to deaths from all causes among the general male population between the ages of 35 and 60 in this country is roughly 25 to 30 per cent.—in other words the mortality from this group of diseases is a high one.

Pregnancy and Leprosy

SIR,—I have read with considerable interest the article on The Interaction of Pregnancy and Associated Diseases by Professor R. W. Johnstone (April 9). In this connexion your readers may be interested in the relationship between pregnancy and leprosy. The leper hospital here under my charge has over two thousand patients of varying nationalities. Some six hundred of these are females and there is on an average about one birth per month.

In the interaction of pregnancy and associated pathological conditions leprosy must be I imagine one of the few major systemic diseases where such action is to all one sided. Leprosy does not have the slightest effect on the course of pregnancy pregnancy has a marked effect on leprosy. A slow but progressive spread of the disease is usual first noticeable in the later months of pregnancy and going on long after delivery. A pregnant woman with mild symptoms of leprosy may and often does become an advanced textbook case in a year's time. The primary factor is I think mineral depletion as in my last twenty cases a richer diet with increased calcium

intake appears to check the tendency to leprosy aggravation

Metabolic disturbances of various kinds frequently precipitate an acute febrile dissemination of leprosy (lepra fever) In over seven years experience I have never seen the strain of pregnancy or parturition cause lepra fever, although I have seen very severe attacks after disturbances of a very much lesser nature—dietary indiscretions or a few days constipation, for instance The leprosy aggravation caused by pregnancy is insidious and chronic In these cases which I see both parents are, of course lepers Routine examinations of placenta, cord, and baby are constantly negative for *Mycobacterium leprae* and the child, if removed from the mother at or shortly after birth, remains free from leprosy—I am, etc,

Selangor, F M S GORDON A RYRIE

The Active Principle of Cannabis Indica

SIR—I am indebted to you for drawing my attention to two papers about *Cannabis indica* which have appeared since my retirement from active work I have now read both of them Neither paper, I venture to submit, supports your contention (*Journal*, June 4, p 1233) R S Cahn's paper (*J chem Soc* 1933 p 1400) is the fourth of a series and is an interesting study of a not yet complete synthesis of a substance he terms cannabinol It is not, however, the same substance as that which was first isolated by Wood, Spivey, and Easterfield (*J chem Soc* 1896, **69**, 539) Cahn's substance is stable, is devoid of pharmacological activity, and has the empyric formula $C_{21}H_{30}O$ *Wood Spivey and Easterfield's substance* was relatively unstable, was powerfully active pharmacologically and had the empiric formula $C_{18}H_{24}O$ I showed that passing oxygen through the warmed substance changed it and destroyed its pharmacological action (*J Amer med Ass* 1898 **31** 882)

The note of Bergel, Todd, and Work (*Chemistry and Industry* 1938, **57**, 86) appears to be a search for something active without much success Their pharmacological experiments were made on rabbits by intravenous medication Rabbits are but slightly susceptible to *Cannabis indica* and do not show characteristic symptoms and the intravenous administration of an insoluble (in water) resinous substance probably as a relatively crude emulsion is not in my opinion an admissible procedure in pharmacological research I will try to justify my statement that the active principle of *Cannabis indica* was isolated, but perhaps not in its purest form, over forty years ago by Wood, Spivey, and Easterfield

They worked with charas the resinous exudation of Indian hemp and the most powerful of cannabis products Their first consignment consisted of many hundredweights of the finest charas I have seen The quality of the initial product is of importance as later research showed They isolated a terpene (1 5 per cent) a sesquiterpene (2 per cent) a crystalline paraffin (0 15 per cent) and a so-called red oil (31 5 per cent) which was only such at high temperatures An indistillable pitch and sandy residue were left behind The products were passed on to me for pharmacological investigation The resin (red oil) was powerfully active (*Lancet* 1897 **1** 235) Later consignments of charas were of inferior quality They yielded less red oil meantime termed cannabinol because it contained an alcoholic hydroxyl which again was less active pharmacologically than the resin first examined

About this time I had to devote myself to other lines of research and the close association of chemist and pharmacologist ceased The chemists continued their work and separated from the newer samples a higher homologue which was pharmacologically inactive but to which they unfortunately gave the name of pure cannabinol It will not be further considered in this note

At the beginning of 1898 I was invited to the Annual Meeting of the American Medical Association held in June of that year Unfortunately I was unable to go I was asked to send a communication to be read As the research work in hand was already earmarked I wrote up the work done on *Cannabis indica* and sent it I believe the paper still remains the most comprehensive account of the pharmacology of this drug The addenda which I was allowed to make summarized 144 animal experiments—thirty three on myself Curiously, Sigmund Frankel writing five years later says "Animal experiments with hashish are in literature extraordinarily few His own experiments are much less numerous but he figures a somewhat characteristic attitude often assumed by dogs which I had previously described as 'hyenoid' Rabbits he says are completely refractory

Since these experiments at Cambridge I have made a large number of chemical and pharmacological experiments with *Cannabis indica* Hemp products have been obtained from various parts, chiefly India and an active cannabinol has been prepared from all of them No further publication has been made because apart from experiments directed to standardizing the drug no sufficient advance was felt to have been made on the Cambridge experiments All that need be said now is that the various cannabinols prepared from these various crude products had not quantitatively the same intoxicating power And I may add as of some slight importance that I sealed hermetically in a test tube some of the very active product isolated at Cambridge and kept it for about twenty years without apparent change or loss of activity

Since the cannabinols prepared by myself from different samples of *Cannabis indica* showed some variation in pharmacological action can this substance be regarded as the active principle of the drug? I think it can and in a simple way and as briefly as possible I will try to justify this opinion Let us return to the active red oil isolated from the first batch of charas and let it be conceded that a constant boiling point is generally an indication of tolerable purity unless by chance we have a mixture of two or more substances with boiling points closely similar The red oil distilled over in a moderate vacuum (20 mm Hg) constantly at 265° to 270° C It contains a hydroxyl group and can be converted into acetyl cannabinol and the acetyl cannabinol can be deacetylized and cannabinol re formed But the new product possesses little if any pharmacological action What has happened? Has something disappeared during the transformation? If it had it would be a very remarkable substance such is at present unknown to pharmacology and I think I may add organic chemistry On the other hand a slight rearrangement of intramolecular structure is a common occurrence of less severe reactions, but on the nature of such change I shall not speculate Mr Cahn I gather prepares his cannabinol by the method of acetalization and deacetalization Although not pharmacologically active it is properly allied to the active principle and its complete synthesis may throw some light on possible group migrations and lead to the desired haven But it is no easy task especially as it is difficult to gauge accurately the activity of different products The best way to standardize cannabis preparations is to take them oneself Even then until one becomes expert the percentage error is considerable I merely wish to state the fact without recommending the procedure

One point more and one that may be particularly disturbing The resin in the examples tried did not show the increased pharmacological effect over the crude drug which it should have done if it were the sole active principle The charas containing 32 5 per cent of resin was somewhat more than half as powerful as the resin itself Although owing to the presence of terpenes the crude drug may be slightly more readily absorbed than the purer resin the cause of the difference is more probably due to some degree of oxidation occurring during the fractional distillation Oxidation is slow at ordinary temperatures but rapid at high temperatures It is probable that oxidative changes begin immediately after

harvesting and products which reach this country have undergone change due to varying age and sometimes to unsuitable storage Other changes too of an intramolecular kind possibly occur producing an inactive or less active product which could not be separated from the real active principle by fractional distillation Variations in activity of different cannabinols might thus be explained

An unstable resin with the properties possessed by an active cannabinol explains all the pharmacology of *Cannabis indica* If the active principle is not such a resin it is difficult to conceive what kind of substance it can be Few active principles would survive the heat which an active cannabinol bears with impunity —I am, etc

Tunbridge Wells June 9 C R MARSHALL.

Excision of the Patella

SIR—Mr G O Tippett states (*Journal* June 11 p 1284) that in kneeling which is probably the most simple common trauma the patella takes *no* part This assertion is incorrect In kneeling with the knees flexed to 90 degrees which is the usual position the patella takes the majority of the weight Mr Tippett can easily prove this for himself provided his patellae have not been excised by flexing his knees to 90 degrees outlining the skin over the knee cap with ink and then kneeling on a piece of paper—I am, etc

Norwich June 21 H A BRITTAIN

"Quinsy-Peritonsillar Abscess"

SIR—'Tis an ill wind that blows nobody good and while the physician may think the fates hard when, like Job— a perfect and an upright man one that feareth God and escheweth evil —he suffers from ailments that, frankly, he would prefer to see in his patients rather than in *himself, yet he has this great advantage that* as a patient he may learn more of a disease its symptoms and *its* treatment, than he would as a mere onlooker Part of this meditation is due to the fact that, when scarlet fever attacked me while house surgeon with the late Sir Hector Cameron my transference to Belvedere Fever Hospital and my six weeks residence there taught me more of fevers than *all the books in my library* But the second and more important reflection leads me as a sufferer for half a life time *from acute recurrent* quinsy to disagree formally with almost all the suggestions in the article by Mr R Scott Stevenson in the *Journal* of June 18 (p 1323) on Quinsy and Retropharyngeal Abscess

For about thirty years *from 1887—the* first attack of which I have a clear recollection—to 1917, when I had my tonsils removed by the late Dr Luc of Paris I suffered every year or two from an acute abscess tonsillar or peritonsillar Your author says that in such cases pus forms about the third or fourth day of the illness which lasts from five to fourteen days but should never be allowed to run its course I frankly disagree when he goes on to state that it does good to open a quinsy early rather than late even if only blood and not pus flows from the incision But I fully agree that opening the abscess is not always as easy as it may sound Not only is it not easy but it is often impossible and every attempt is made at the cost of extremely acute pain to the victim It is not uncommon he adds to fail to open the abscess even after several attempts As the wretched patient can with difficulty open his mouth a quarter of an inch and is hypersensitive this is not to be wondered at Even with the efficient 7s 6d battery on the forehead obviating the use of a torch in the unsteady hands of an assistant and the benzo-cocaine lozenge or the 10 per cent cocaine spray the author admits that no local anaesthetic has much effect in quinsy If the abscess fills again after a second incision the author concludes that it will be well to consider whether the tonsil should not be removed

Vous avez commis une grosse imprudence was the emphatic remark I heard Professor Tillaux, thirty years ago make to an assistant who removed a tonsil in a state of acute inflammation and suppuration—a lesson I never forgot My personal experience as a patient and in no way as a throat expert is that quinsies should not be opened till pus has definitely formed that less harm is done by waiting than by early intervention that 10 per cent cocaine *is a dangerous spray and that tonsils should only be removed* when all inflammation has subsided—I am etc

The Origin of Cancer

SIR—In your leader in the *Journal* of June 18 (p 1317) the opening statement that the idea has long been abandoned that the cause of cancer will be discovered if taken at its face value seems calculated to act as a knock out blow to some of those engaged in cancer research Although most laboratory work on this subject is now done for the avowed purpose of adding a few more facts to the colossal heap already accumulated there are among these researchers many who are sustained in their efforts by the hope that they may one day chance to stumble upon a clue which leads the way out of the intricate maze that now represents the cancer problem To these latter and still more to those who enter upon this research with the definite object of finding a cause an authoritative statement that cancer has no cause and that they are condemned to wander round and round in never ending if benign circles or segments of circles as they are now doing but without the incitement of hope must be anything but an encouragement

Surely the above mentioned statement does not represent the opinion of oncologists in general? There are in fact many clinicians and pathologists working at this subject who have reason to think differently May I take the liberty of doing my best to present this other side of the case

My object is to show that not only will the causes of cancer be found but that they have already been found and are now being sorted out and investigated Writing as an advocate for the optimists I put my case in the form of propositions as follows

Cancer is not one disease but a vast group of diseases Cancers are primarily of internal origin as contrasted with the bacterial diseases which are primarily of external origin Cancers vary in kind with the nature or species of tissue or of animal so that cancer of one species of tissue differs from that of another species and cancer of one species of animal from that of another species As with the bacterial diseases the causes in general are twofold (*a*) predisposing and (*b*) activating

(*a*) The predisposing or facilitating causes happen before the onset of development and bring on degeneration before it Among these causes are heredity The state of predisposition produced is the connective tissue and the cancer and is common [illegible] cancer

(*b*) The activating causes are agents—chemical or physical—which act impulsively upon the degenerate, dedifferentiated embryonoid cells of pre cancers and cause them to multiply, much as agents of a similar nature activate the eggs of sea urchins or other lowly organisms and cause them to multiply But whereas in the former the cells activated are progressive in the latter they are regressive and therefore incapable of producing other than degenerate parasitic organisms In both cases the activating causes are selective or specific and vary with the species of animal or the species of tissue upon which they act

Let us now choose some one organ as an example, preferably the female breast that being to the clinician what the mouse is to the experimentalist Owing to disuse or inadequate use in suckling, and/or to heredity, the breast may degenerate before its normal time Its dedifferentiated embryonoid cells, instead of quickly passing on to the final stage—that of molecular degeneration—as they should do, are stimulated and kept alive by hormones from the ovary, an organ which has not shared in the premature degeneration of its satellite organ They proliferate to some extent, and are those "pre cancer cells" which fill the ducts and follicles in the fibrocystic predegeneration known as Schimmelbusch's disease If left alone these pre-cancer cells continue their course and disintegrate But should they be stimulated by some adequate and suitable stimulus, such as that of a streptococcal toxin, of radium, of some mechanical injury, or, above all—in the breast—of the luteal hormone, then they may start off on that process of endless multiplication which is cancer

This represents the cause of cancer in its simplest form There are, of course, variants such as when cancer is caused by x rays, when the same agent first brings on a state of premature degeneration and then activates the predegenerate cells

It is with much diffidence that I have ventured to comment in this way on a statement which I recognize as that of an authority And as I am conscious of having presented my case rather awkwardly, perhaps I may be permitted to make it clearer by using a precedent It was not very long ago that it might with truth be said of tuberculosis that it was attributed to such a multitude of causes that of only one thing could we be sure, and that was that its true cause had not been discovered But now we all agree that the cause of tuberculosis is known and that it is twofold—a bacillus which is the actual cause, and a group of causes, all of which can be lumped together as the predisposing cause It is these two—the seed and the soil—which together constitute the cause of tuberculosis My claim is that we now know enough about cancer (and cancers) to be able to say that we know its causes in the same way that we know the causes of the microbial diseases in general and of tuberculosis in particular With cancer as with the diseases of extrinsic origin we have passed from the stage in which the true cause is lost in a multiplicity of causes to that in which the causes are well defined and can be linked together as one

Now the question arises Which of these views is correct—the one which denies that the cause of cancer will ever be discovered, because a malignant neoplasm is the resultant of a number of factors or the one which states that the cause of cancer is already known and that it is duplicate or divisible into two factors?—I am, etc,

*** Perhaps the word the should have been put between quotation marks and not the words 'cause of cancer"—ED *B M J*

Diphtheria Prophylaxis

SIR,—During 1937 four cases of small-pox were notified in England and Wales with no deaths (*Journal* June 4, p 1243), whereas during only one week of this year 1,110 cases of diphtheria were notified with twenty-six deaths, an increase incidentally of 260 and six, respectively, on the corresponding week of the previous year (*ibid* p 1244) There can be little reasonable doubt that the remarkable position in respect of small-pox is due largely to compulsory vaccination, unless a conscientious objector the father is not allowed to disfigure his child with small-pox, but he may with impunity expose him to the grave risk of diphtheria

About 90 per cent of children between the ages of 6 months and 5 years are said to be Schick-positive Among 3,000 such children in a London borough who were immunized against diphtheria two or three years ago not a single case of the disease has since been reported In view of what has been achieved in small pox surely it is not too much to ask that all children in this country should be immunized The bogy of diphtheria looms larger in the public mind even than that of small pox at the present time

It is well known that Schick-positive nurses, doctors and medical students, whose professional duties take them into contact with sick children, are very liable to contract diphtheria, and this is recognized and guarded against in most hospitals—and should be in all hospitals It seems incredible that there are still hospitals in this country where immunization in such cases is not insisted upon, even where successive residents have taken the disease

Dr W Hilton Parry's communication in the *Journal* of June 11 (p 1264) raises interesting possibilities in the treatment of early cases with severe toxaemia It would be valuable to hear from him whether sulphanilamide given to such cases before removal to hospital may be expected to be beneficial, and whether in fact the whole course in these patients in whom a streptococcal toxaemia is presumed is influenced by the drug—I am, etc

London June 22 A L CRADDOCK

Treatment of Diphtheria

SIR,—I am much interested to see Dr W Hilton Parry's note on the treatment of diphtheria in the *Journal* of June 11 (p 1264) It forestalls to some extent a three year investigation of my own

For some time I have found that cases admitted as diphtheria required a great deal of investigation as to the causation and that swab diagnosis was liable to grave errors It is as well to query all cases of over 17 years of age, even with a positive swab, and many under that age Mixed infections such as Vincent's angina and streptococcal throats with or without the presence of diphtheria bacilli are quite common, very frequently the diphtheria bacilli are avirulent, if treatment is carried out with antitoxin alone the results are often disastrous Fortunately grave cases may be diagnosed clinically and treatment accorded It is my practice here to use anti streptococcal serum or prontosil and, if necessary some arsenical preparation for such cases, with anti diphtheritic serum if required

The cases admitted to hospital as diphtheria, with or without a positive swab have shown that the diagnosis must be revised in about two cases out of three I think the time has come for 'observation throats' requiring hospital treatment to be admitted freely to the infectious

diseases hospital and to be diagnosed there In Sunderland we do admit such cases, and they require hospital treatment more in many instances than diphtheria I often wonder how many cases with a negative swab are left at home unnotified that would have benefited by quick removal to hospital and a dose of anti-streptococcal serum During the past year or two more than half the cases that have been admitted to the Sunderland Infectious Diseases Hospital as diphtheria have actually been streptococcal throats or Vincent's angina and required treatment for these conditions The swab seems useless to diagnose such cases, smears are more helpful but in the former blood culture appears the only useful procedure, if obtained early enough

I hope shortly to publish an article on the differential diagnosis of acute throat conditions based on the cases admitted under my care during the last ten years As it is swab diagnosis leads to an entirely fallacious number of notifications of diphtheria suggesting a much greater prevalence of diphtheria in many districts than actually exists, and this would be prevented by adding a new indefinite throat condition to the notification list Many cases are notified as diphtheria merely because the clinical condition suggests the need for hospital treatment since there are no beds for acute throat conditions other than diphtheria Many practitioners have told me that a notification of diphtheria is the easiest way to get a bad throat into hospital—I am etc,

Sunderland June 17

Keratoplasty

SIR—Mr T H S Tizzard records in the *Journal* of June 18 (p 1303) an excellent result in a case in which corneal grafting was done by a conjunctival flap An examination of the photographs of this case suggests that the corneal scar was dense and localized to the centre of the cornea the rim of the pupil is seen The operation of corneal grafting is hazardous and entails a high degree of risk, it is a moot point whether in these cases of localized opacity an optical iridectomy is not the better operation to perform from the patient's point of view I have always advocated that a corneal graft should not be carried out unless the vision of the affected eye was reduced to perception of light and the cornea was generally opaque Furthermore a graft may remain comparatively clear for a year and then suddenly become opaque—I am etc,

London, W1 June 22

Atrophic Rhinitis

SIR—I much appreciate the courtesy of Mr E D D Davis's reply (*Journal* June 18 p 1341) to my letter (June 4 p 1236) May I add that I also appreciate his scepticism as to sinusitis being an essential factor in atrophic rhinitis It is only after an experience of 170 cases over more than thirty years that I have come to this conclusion, treatment accordingly has by its success confirmed my belief The view that atrophic rhinitis is the end stage of a hyperplastic—that is inflammatory—process is proved by the history of the cases and by their histology How a neglected nasal suppuration beginning in childhood and lasting for years could miss the ethmoid has never been explained

The inflammatory process beginning in the mucous membrane and allowed to become chronic affects the bone, just as it does in chronic suppurative otitis media beginning in childhood The latter disease and not otosclerosis is the aural analogue of atrophic rhinitis its history histology and treatment are similar The mastoid process and antrum in the one case the nose and maxillary antrum in the other tend to remain small Thrice I have seen the mastoid antrum obliterated and in one boy the maxillary antrum was almost obliterated Leucocytic infiltration is succeeded by fibrosis and then sclerosis the microscope shows this in both diseases The fibrosis by constricting the vascular supply to the mucoperichondrium of both surfaces of thin bones like the turbinates and ethmoid cells, hinders development and causes sclerosis and atrophy Nature sometimes cures the condition by a gradual atrophy of the ethmoid honeycomb but this takes many years and then the atrophy is extreme it is the rhinologist's job to anticipate this and to deal with the ethmoidal focus which keeps the process going and so to prevent further atrophy of the turbinates The sphenoid also often needs drainage the antrum less often Unlike the ethmoid the antrum has a rich blood supply other than on its nasal wall and the walls thicken even when it contains no pus Like Mr Davis I have often punctured the antrum with negative result but this does not negate sinusitis of the ethmoid or sphenoid Usually there is an offending cell high up and far back in the ethmoid apt to be missed and often leading to the sphenoid Usually also the clearing out of the ethmoidal cells with due attention to neighbouring cavities when necessary will stop the crusting Lack of vitamins is a predisposing factor in these children with dirty noses and for successful treatment must be met Possibly a defective supply of magnesium salts may also be a factor these salts are essential for ciliary function—I am etc

JAMES ADAM

Glasgow June 21

Tuberculin in Diagnosis

SIR—The evidence for my belief that the subcutaneous test is selective may be stated quite shortly A patient with tubercle bacilli in the sputum is obviously suffering from pulmonary tuberculosis When treating such cases with tuberculin my first dose in treatment is 0 0000001 c.cm B E Why? Because patients with active disease may give a febrile reaction even to a dose as small as this In Chapter VI of *The Tuberculin Handbook* I have set out a series of 106 cases in which the diagnostic value of the subcutaneous tuberculin test was compared with the radiographic evidence The cases were those of suspected pulmonary tuberculosis without tubercle bacilli in the sputum If Dr J R Forbes will refer to that work he will I am sure agree that the radiographic evidence was in favour of the subcutaneous test being selective—I am etc

HALLIDAY SUTHERLAND

London W 8 June 24

SIR—I have proved beyond doubt and have certainly convinced the leading ophthalmologists at the Royal Westminster Ophthalmic Hospital—notably Mr Charles Leonard Gimblett Sir Richard Cruise Mr T K Lyle and Mr E Wolff—that tuberculin is the essential key to *the diagnosis* and is also the only safe and certain key to the successful treatment of tuberculous diseases of the eye within range of vision and even in other organs and parts of the body although we cannot observe directly and control with our eyes the phenomena of healing Dr J P Forbes will find my book *Tuberculin in the Diagnosis and Treatment of Tuberculosis* probably at the Library of the Royal Society of Medicine and certainly at the Library

the Royal College of Physicians This and my last book *Tuberculin : its Vindication by Technique* (J and A Churchill) will disclose the truth Clear proof can also be seen any Monday afternoon at my Tuberculin Clinic 36, Nottingham Place—I am, etc,

London, W 1, June 25 W CAMAC WILKINSON

Complications of Gold Therapy

SIR—Referring to the letter of Dr John B Bennett in *the Journal* of June 25 (p 1392) describing a case of gold 'dermatitis,' we are constantly treating considerable numbers of patients at the Charterhouse Clinic with injections of gold with most satisfactory results, and in some cases quite dramatic improvement In our series we have never had any toxic reaction of any kind whatever, nor has any single patient ever developed a dermatitis We are convinced therefore that these complications are entirely unnecessary, and are simply due to the method of administration, and more particularly to the amount of gold given

Gold is most valuable when interposed in a course of vaccine treatment where hyperergy develops The gold is given in minimum doses at as long an interval as possible, depending on the tendency of the symptoms which are allayed by the gold to recur The usual period is a fortnight, but three weeks or even a month may elapse during which period the symptoms are relieved It is true that after the first injection there may be an exacerbation of the rheumatic pains, and if this is found to occur on the next occasion the amount of gold injected is one-tenth of the initial dose In rare cases even one hundredth of the dose is required before relief is obtained The kind of gold salt used does not appear to make very much difference—I am, etc,

London W 1, June 27 H WARREN CROWE

Blood Pressure after Spinal Anaesthetic

SIR—Mr D L Lewis and Dr E G M Palser (*Journal* June 4, p 1202) state that falls in the systolic and diastolic blood pressures after a spinal anaesthetic are regular and begin 2 6 and 2 2 minutes after administration ceasing after 13 and 12½ minutes for the systolic and diastolic pressures respectively They say the recovery is to the extent of 7½ to 10½ per cent of the initial values and occupies eight minutes

Looking back at records taken during the past year of blood-pressure curves following spinal analgesia alone, I find a great variation in the times of onset and recovery In all cases the anaesthetic is the same but some exhibit only a slight fall and others go on falling for fifty minutes This divergence of results is interesting because it points to the fact that spinal analgesia alone is not adequate to protect the patient from shock-producing stimuli except in the case of very low blocks—I am, etc

Demonstrator in Anaesthetics, University of Liverpool

Three professors of the Lyons medical faculty have recently retired—namely Drs Collet (oto rhino laryngology) Cluzet (biological physics radiology and physiotherapy) and Gayet (urological chemistry) A new chair has been founded at the faculty for infectious diseases and its first occupant is Dr Joseph Chalier hitherto professor of medical pathology

Obituary

JOHN V W RUTHERFORD, M B, C M

Consulting Surgeon Newcastle on Tyne Infirmary

The death took place on June 21 of Colonel J V W Rutherford in his eighty-second year John Victor Walton Rutherford was educated at Bedford School, subsequently proceeding to the Royal High School, Edinburgh, and later to Edinburgh University, where he graduated M B C M He was for some time honorary surgeon to the Newcastle Royal Victoria Infirmary Before and during the war he held the position of Assistant Director of Medical Services of the 50th Division and was mentioned in dispatches for his services in France After returning from France he became D M S at Catterick Camp, from 1918 to 1922 he was Honorary Colonel of the R A M C (Northumbrian Division) On his retirement from the Newcastle Infirmary he went to reside in the South of France, but returned to Newcastle last September He had been in indifferent health for the last two years Colonel Rutherford was a keen sportsman and one of the stalwarts of Rugby football and did notable service in the Northern Football Club and the Northumberland Rugby Union Of a kindly nature, he was most popular with all with whom he came in contact, and his death will be regretted by his many friends in the Newcastle-upon-Tyne district He is survived by his wife and one son His first wife was the daughter of the late Sir Walter Scott, she died in 1922

Professor G Grey Turner writes

With his brother, the late Dr Vickerman Rutherford, John Victor Walton Rutherford started in general practice in Newcastle-on-Tyne to carry on the work of their father who was not only a successful practitioner, but a very well known educationist It was, in fact, as a result of the efforts of John Rutherford senior that the College which still flourishes under his name was founded

The subject of this note was educated in Edinburgh where he was well known as a Rugby player He was always attracted to surgery, and when the opportunity arose at the Newcastle Infirmary he sought election In 1897 he became assistant surgeon and for some years was associated in that capacity with Professor Rutherford Morison In 1906 he was appointed to the full staff with charge of wards and continued in that office until 1917, when he retired on reaching the age limit and was made an honorary consulting surgeon John Rutherford had a great knowledge of human nature and was very shrewd and sometimes made striking diagnoses by some process of intuition He was always considerate to his patients and was popular with his colleagues Rutherford had good hands and was a very nice operator but was not attracted to the routine of hospital work or of teaching but he did encourage the junior members of his firm and gave them many opportunities and was always interested in their exploits I was associated with him at the Newcastle-on-Tyne Infirmary during the whole of my hospital service as registrar and as assistant surgeon and am grateful for the encouragement which I received Comparative affluence at that time enabled Rutherford to enjoy those country pursuits at which he was an adept and also allowed him time to take a very active interest in the old volunteers and in the Territorial Army At the outbreak of the late war he was A D M S for the Northumbrian Division of the Territorial Army and served in France in that capacity

'Colonel John,' as he was always known, was immensely attached to his own homeland and to the Newcastle-on-Tyne Infirmary, and when his health began to fail very seriously during the last year or two he returned to Newcastle where he died. He was buried in Benwell Churchyard not far from his old home on June 21, the funeral being attended by some of his old residents.

F. J. BAILDON, M.B., C.M.

Professor R. J. A. Berry writes:

During the now steadily accumulating burden of years in which it has been my weekly task to open the *British Medical Journal* and at least to glance through its pages I have from time to time been saddened by learning of the unexpected death of some old friend or former colleague. That the issue of June 25 should have accidentally opened at the very page recording the totally unexpected death of a life-long and greatly honoured friend, Dr. F. J. Baildon, was as melancholy a coincidence as it was an extraordinarily grievous shock. No man could have known Francis Baildon as long and as intimately as I did without realizing his lovable nature, his high ideals, his sincerity and loyalty as a friend, his scrupulous observance of the highest and best traditions of the profession he loved so well, and his abounding and abiding devotion to his and my Alma Mater—the University of Edinburgh.

Most men if they are honest, at least with themselves, would readily admit their indebtedness in life to some apparently trivial circumstance. Baildon was a very early and lasting influence in my life. He it was who advised me to abandon commerce for medicine, who assured some strangely doubting relatives of my ability to pass the then by no means difficult professional examinations which barred the aspirant's entrance to medicine, and who finally sent me to his own university. It was therefore with a special and peculiar pleasure that only a few months ago I accepted his invitation to attend, under his presidency, the dinner of the Manchester Edinburgh University Club, and to propose, under his kindly dictatorship, the toast of *Alma Mater—his and mine*.

Such were my first and last recollections of Francis Baildon. His friendship meant much to me. Never did we meet in London, whatever the business, without a dinner at his club on the sweet shady side of Pall Mall—and here did Baildon reveal his richly cultured mind, his extensive knowledge of life, love letters and art, and rarely was a man's after-dinner talk more worth the listening to. To him then a man to whom I owe more than to any other of his time and generation of those better things which alone make life the better worth living do I pay this last personal and affectionate tribute.

WILLIAM HUDSON, M.D., D.P.H.

Dr. William Hudson died at the age of 54 at his home in Bedlington, Northumberland, on June 19. He had been in failing health for over two years, but had continued to serve his patients up to within two months of his untimely death. He was born at Bedlington and received his early education at Morpeth Grammar School. His medical training was at Durham University College of Medicine, and he there proceeded to the degrees of M.B., B.S. Subsequently he obtained his M.D. and D.P.H. at the same school. He conducted a large panel and private practice in his native town, and also held the offices of medical officer of health, Poor Law medical officer, and public vaccinator. Dr. Hudson was a most energetic and conscientious practitioner, and was held in very high esteem by colleagues, patients, and friends. He was generous in disposition, and had a great capacity for making and retaining friendships. He was in great demand at all social functions in his neighbourhood, and his quick tongue and ready wit made him exceptionally popular. He had been a member of the British Medical Association since 1915, and had been chairman of the Blyth Division. He is survived by his wife and two sons, one of whom has already embarked on a medical career.

Dr. Wilbur C. Lowry (honorary secretary of the Blyth Division) sends the following appreciation. By Dr. Hudson's untimely death Blyth Division and the British Medical Association have lost a most influential and active member. He was never absent from any meeting of the Association in the district except on urgent business. He could be relied upon to contribute to the value of a scientific meeting by pointed questions or by information or criticism of a practical and pertinent nature. At a medico-political meeting his advice was of that broad-minded nature which enhanced the practitioner's status in the neighbourhood as an individual and as a member of the community, while at the social gatherings he was able to relax and enjoy a song or story to the full. Dr. Hudson was chairman of the Blyth Division on two occasions in recent years and until failing health compelled him to relax was a member of the Executive Committee. He was also a member of the Contract Practice Committee of the North of England Branch. He was a most energetic worker and was reported to have a store of odd jobs on hand on which he could draw if routine demands became slack. As a practitioner Dr. Hudson was cool, detached, and accurate in his observations as befits a scientific mind, shrewd and quick in his deductions which gave him the reputation of being good at diagnosis and as a result efficient and helpful in treatment. And in addition wherever one met him whether at the bedside of a patient, in general discussion or in public service one had the impression that the central object in all this concentration and energy was an individual patient who required treatment as a human being rather than as the medium of some interesting disease. Herein lay Dr. Hudson's success as a general practitioner and as a public administrator, and above all as an individual himself.

We regret to record the death of Dr. LEONARD CHARLES TALBOT DOBSON, latterly of Bournemouth and formerly of Holland Park Avenue, London, where he practised for some years with his son Dr. Eric Dobson, who died in February 1937. Leonard Dobson was born in London in 1864 and received his education at Cranleigh School and St. Bartholomew's Hospital. In 1885 he obtained the diplomas M.R.C.S. and L.S.A., and in the following year the L.R.C.P. when he graduated M.B. Lond., winning the gold medal and first-class honours in obstetrics, and proceeding M.D. in 1888. He had been a member of the British Medical Association for fifty-one years. One of his earliest posts was that of senior clinical assistant in the Throat Department at the West London Hospital; he was also electrical assistant at St. Bartholomew's Hospital from 1905 to 1910, and physician in charge of the electrotherapeutic department of the Freemasons' Hospital. His connexion with the West London Hospital was especially close for a long time, and he was an ex-president of the West London Medico-Chirurgical Society. He contributed to its journal articles on the injection of ether into the abdominal cavity after operations on septic cases, the use of radium in the treatment of lupus erythematosus, and the practical treatment of rheumatoid arthritis. He was a devoted Freemason, and travelled frequently from Bournemouth to attend meetings of the Cavendish Lodge, of which, like his son later, he was for a term W.M. His death is mourned by a large circle of friends and col-

Dr ROYAL SAMUEL COPELAND the only physician serving in the United States Senate, died at Washington on June 17, aged 69 A graduate in medicine of the University of Michigan he had been Director of the Flower Hospital and Health Commissioner for New York City

The following well-known foreign medical men have recently died Dr ALBERT PETERS emeritus professor of ophthalmology at Rostock University, aged 76, and Dr FREDERIC MOUISSET honorary physician to the Lyons hospitals corresponding member of the Academie de Medecine and officer of the Legion of Honour

Medical Notes in Parliament

The Royal Assent was given on June 23 to the Prevention and Treatment of Blindness (Scotland) Act, the Infanticide Act, and the Housing (Rural Workers) Amendment Act

In the House of Lords on June 28 the Criminal Procedure (Scotland) Bill, which has passed the House of Commons, was read a second time

The House of Commons this week completed the Committee stage of the Finance Bill

The Tuberculosis (Attested Herds) Scheme, 1938 was laid on the Table of the House on June 27, as was also the Annual Report on Alkali etc, Works

On June 28, in the House of Commons on the motion of Earl Winterton a return was ordered of licences granted under the Act of Parliament for experiments performed in 1937 and the registered places at which such experiments might be performed

In view of the volume and importance of the work connected with air raid precautions, Mr Geoffrey Lloyd, Parliamentary Under-Secretary of State for the Home Department, will devote practically the whole of his time to assisting the Home Secretary in the conduct of this branch of Home Office business Earl Winterton, Chancellor of the Duchy of Lancaster, will help the Home Secretary with his other work

Assessing Nutrition in School Children

During the debate on the Education Estimates on June 20 Mr KENNETH LINDSAY said there had been criticism of the clinical method recommended by the Board of Education for the assessment of the nutrition of school children There were admittedly inconsistencies between the returns for similar areas showing that different standards had been adopted by school medical officers They would all like to find some index which would accurately measure malnutrition It was not easy when dealing with 5 000 000 children to arrive at a proper method of assessment unless they proposed to give school meals to all on a contributory basis and if they did that they would have to be prepared for the appropriate expenditure He was sure no one would desire such an index more than the Advisory Committee on Nutrition yet they stated that the Board's own method which was being used at the moment was the most promising Various alternatives had been suggested which he as a layman had examined and which experts had long ago worked out but they all had serious limitations They did not apply the test which the Board required and the Board therefore was bound to conclude that the clinical method based on the opinion of an experienced physician was the best at present open to them He did not say they could not discover a better but at present it was the best available and if applied with skill and most of all with understanding it discovered the great majority of children whose nutrition was defective The returns for 1937 showed an increase in the percentage of children with excellent nutrition and a slight fall from 0 7 per cent to 0 6 per cent in the percentage with bad nutrition Deficiencies in diet still existed but there were other causes of subnormal nutrition such as heredity want of sleep bad environment and the effects of illness or infectious disease The past year had shown an increase from 248 to 264 in the number of local education authorities which provided free meals or milk for necessitous undernourished children

Paratyphoid Outbreak in the Isle of Lewis

On June 21 Mr WEDDERBURN replying to Mr M MacMillan said that an official report had been received by the Department of Health for Scotland regarding the outbreak of paratyphoid fever at Aignish, Isle of Lewis The investigation by the county medical authorities suggested that there was *no common source of infection* such as milk or water but indicated the possibility of the outbreak having arisen from the consumption by one of the patients of shell fish on the seashore The Department of Health were advised by the county medical officer on May 18 that there had been no fresh cases for three weeks and that the outbreak might be regarded as over

Mr MACMILLAN asked whether in view of the fact that about two months after the outbreak of the epidemic apparently no investigation had been undertaken and no report made the Under-Secretary would explain at what time the investigation was actually made

Mr WEDDERBURN The Department received from the medical officer on April 27 a report on the outbreak of paratyphoid The first case was brought to the notice of the assistant medical officer of health for Stornoway on April 16 and according to the latest report there had been no further cases since April 27

Legislation on Government's Milk Policy

Dr ELLIOT announced with regret on June 22 that it was impossible for legislation to be introduced and considered this session which would give effect to the Government's proposals on milk policy The Government hoped to introduce such legislation next session and as an interim measure would ask Parliament before the Summer Recess to extend the chief provisions of the Milk Acts until September 30 1939 An extension of Section 11 of the 1934 Act would enable Exchequer contributions to be made towards the cost of schemes for cheap milk for school children and for expectant and nursing mothers and children under school age To facilitate development of these schemes the Government would ask Parliament to provide £250 000 in addition to the £500 000 hitherto made available annually

The Milk (Extension and Amendment) Bill was presented in the House of Commons by Mr W S Morrison supported by Dr Elliot on June 24, and was read a first time Its purpose is to extend certain temporary provisions of the Milk Acts 1934 to 1937 to release milk marketing boards and the Government of Northern Ireland from certain obligations under those Acts and for purposes connected with the matters aforesaid

B M A's National Medical Service Proposals

Mr WALTER GREEN inquired on June 23 whether the Minister of Health had considered the report recently published by the British Medical Association outlining a scheme for a national health service, and whether he intended to take any action in the matter Dr ELLIOT said he was not yet in a position to indicate the attitude of the Government in the matter

Maintenance of Child Health

The Estimates for the Ministry of Labour were discussed in the House of Commons on June 24

Mr L S AMERY said the State should consider at any rate the minimum conditions of health for children The State contributed to the maintenance of a worker's children when he was dead Should it make some allowance for the sustenance of those children while he was alive if his wages

were inadequate to sustain them? The present flat rate wages system meant that the coming of each additional child was a hardship to the rest of the family and to itself. A survey of milk consumption in working-class households showed that the consumption per head fell in the larger families just where the need of it was greatest. The medical officer of a large industrial concern wrote that working class parents could have only one or two children if they were to afford an adequate diet for them. That was a major national catastrophe. All but the most improvident elements in the community were yielding to the inducement to restrict their families.

Dr HADEN GUEST said the Minister of Labour should call for a report on the physical condition of all families on unemployment assistance. A medical report on its condition should be rendered at least once a quarter so long as a family was receiving unemployment assistance. If the Minister received these reports he could not resist the argument for increasing the allowances to an amount adequate to give those children proper food. Dr Guest suggested that Parliament should abandon the effort to find the elusive standard of malnutrition and should say that if a child did not come up to a reasonable standard of health and nutrition it should be treated as undernourished. As an old consultant medical officer of the London County Council he assured the House that this would be an easier way technically. The Minister should consider a scheme to provide cheap milk in the home. In Ulster by administrative measures the price of milk had been reduced by about one-half compared with the price in this country. Why not have a five years plan to improve the nutrition of the children in this country?

Mr ERNEST BROWN said he desired to say a good deal about family allowances and the relation of human need to the wage structure but would do so on another occasion.

A motion to reduce the Ministry of Labour vote was rejected by 200 to 97.

Refugee German and Austrian Doctors

On June 25 Mr PARKER asked the Home Secretary whether refugees from Germany and Austria were allowed to practise as doctors or dentists in this country if suitably qualified and whether the Government in dealing with this question, consulted the principal professional organizations concerned.

Mr LLOYD said that permission had been given in a limited number of cases to refugee doctors and dentists from Germany to practise their profession after admission to the British *Medical* and *Dental Registers*. The question of admitting a further number of refugee doctors and dentists from Austria was under consideration. Before reaching a decision the Home Secretary proposed to consult representatives of the medical and dental professions in this country.

Constitution of Ophthalmic Benefit Committee

On June 28 Major MACNAMARA asked the Minister of Health why the Ophthalmic Benefit Approved Committee which was a statutory committee did not give their names to bona fide persons who had to appear before them or had to have dealings with them and if he would state the names of the Committee. Mr BERNAYS said that the Minister was not aware that the Ophthalmic Benefit Approved Committee had declined or would decline to give the names of the members to any persons with whom they had official relations. The Committee consisted of fourteen representatives of approved societies and an equal number of opticians with Sir Robert Young M.P. as chairman. There were also two official observers with no voting power one from the Ministry of Health and one from the Department of Health for Scotland.

Detention of Mental Defectives

In the House of Lords on June 27 the EARL OF MUNSTER moved the second reading of the Mental Deficiency Bill which has passed the House of Commons. He explained that the Bill adjusted a position of serious difficulty which had arisen from a recent judgment of the Court of Appeal in connexion with the Mental Deficiency Acts. The Board of Control which had to review the position of 7,000 patients each quarter had been advised that they could have a few days after the end of each quarter in which to make an order continuing the period of detention if they thought fit. The Court of Appeal, however expressed the opinion that there was clearly a slip in the drafting of the Mental Deficiency Act of 1913 which ought to be put right by legislation. As the law now stood there were thousands of persons of this kind against whom orders had been made in complete good faith after taking counsel's opinion and exercising every care and at the moment these orders were invalid. It was impossible as the law now stood for the Board of Control at quarter days to examine 6,000 documents and in addition look into certificates and reports to see if they were justified in continuing the orders. The Bill declared that the orders which had been made were valid and that an order made under the Act of 1913 might be continued by an order made by the Board of Control within one month after the date on which but for the Bill the order would be limited to expire. Probably the whole of the month would not be needed but it really was not in the interests of the deficients that the Board should not have time to consider the matter before making the necessary order.

The Bill was read a second time.

Sleeping Sickness Free Treatment in Necessitous Cases.—On June 21 Mr PARKER asked the Minister of Health whether in view of the difficulties and financial burden incurred by any family in which there was a case of sleeping sickness he would consider the provision of free treatment and care for persons suffering from this disease. Mr BERNAYS said no serious difficulty had been experienced in securing suitable accommodation for persons suffering from this disease and where the accommodation was provided by a local authority the authority had power to remit any charges if they were satisfied that the financial circumstances of the patient justified this course.

Malaria Units in British Colonies.—Mr MALCOLM MACDONALD stated on June 22 that in the southern United States full time malaria units consisting of a physician an engineer and an entomologist were now added to the staffs of State health departments and that similar steps had for some years past been taken in most British colonies.

Cleanliness of Milk Containers and Churns.—Answering Sir Joseph Leech on June 23 Dr ELLIOT said the Milk and Dairies Order 1926 required every vessel used for containing milk to be kept at all times in a state of thorough cleanliness and in particular to be washed after use and cleansed and scalded with boiling water or steam before it was used again. Dr Elliot further said that the Milk and Dairies Order 1926 placed a duty on the dealer to clean churns thoroughly before returning them to the producer and on the producer to cleanse and scald with boiling water or steam all vessels used by him for containing milk. Failure to carry out these duties was an offence punishable by fine. He was not satisfied that an attempt at closer definition would assist in the administration of the law.

Superannuation Scheme of Mental Hospital Officers.—Captain ELLISTON asked on June 23 whether as under the Asylum Officers Superannuation Act 1909 an officer dismissed for misconduct might at the discretion of the visiting committee be entitled to a refund of contributions where no refund could be sanctioned in the case of an officer who voluntarily resigned it was proposed to correct such anomaly by amending legislation. Dr ELLIOT in reply said the superannuation scheme applicable to asylum officers was very liberal the benefits being high and the contributions paid by them low. As at present advised he saw no reason to propose the suggested amendment.

Committee on Nursing Service.—The committee [illegible] with the nursing service is still engaged in the [illegible] evidence and Dr Elliot cannot say when [illegible] position to issue a report.

No 24

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended June 18, 1938

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for (a) England and Wales (London included) (b) London (administrative county) (c) Scotland (d) Eire (e) Northern Ireland Median values for the last 9 years for (a) and (b)

Figures of Births and Deaths, and of Deaths recorded under each infectious disease are for (a) The 126 great towns (124 in 1937) in England and Wales (including London) (b) London (administrative county) (c) The 16 principal towns in Scotland (d) The 11 principal towns in Eire (e) The 10 principal towns (9 in 1937) in Northern Ireland

A dash — denotes no cases a blank space denotes disease not notifiable or no return available

* 1 case in Belfast

† After October 1 1937 puerperal fever was made notifiable only in the administrative county of London

‡ Death from puerperal sepsis

§ Includes primary form in figures of England and Wales London (administrative county) and Northern Ireland

EPIDEMIOLOGICAL NOTES*

Enteric Fever

During the week under review there were 15 notifications of enteric fever in England and Wales compared with 10 in the previous week of these 5 (2) were in London—2 in Battersea and 1 each in Chelsea Kensington and Woolwich In Scotland there was 1 case of paratyphoid fever in Greenock

Diphtheria and Scarlet Fever

In England and Wales notifications of diphtheria fell in the week under review from 912 to 889 but in London there was an increase of 2—113 to 115 Notifications of diphtheria rose slightly in Scotland and in Eire there was a considerable increase in Northern Ireland however an appreciable drop was noted Deaths in the 126 Great Towns of England and Wales rose from 23 to 29 while in London they fell from 4 to 3 Of the 29 deaths from diphtheria recorded in the 126 Great Towns 3 (1) occurred in South Shields and 2 each in Liverpool (1) and Derby (0) There were 4 deaths from diphtheria in the 16 principal towns of Scotland during the week—3 (0) in Glasgow and 1 (0) in Paisley There was a slight rise in the notifications of scarlet fever in England and Wales during the week under review—1 746 compared with 1 743—and in London where 156 cases were recorded as against 149 in the previous week In England and Wales the figures were in excess of the median value for the last nine years but in London they were considerably less In the Great Towns of England and Wales 5 deaths from scarlet fever were recorded compared with 4 in the previous week there were no deaths from scarlet fever during the week in London Notifications in Scotland fell from 420 to 383 with no deaths while in Eire and Northern Ireland they rose from 74 to 76 and 66 to 77 respectively in Northern Ireland there were 2 deaths —both in Belfast

Primary and Influenzal Pneumonia

Notifications of primary and influenzal pneumonia in England and Wales fell from 801 to 787 during the week under review and in London from 63 to 49 both these figures were well below the median values for the last nine years for England and Wales and for London Fewer deaths from influenza were reported in England and Wales and London during the week also in Scotland where they fell from 2 to 1 In the West Riding (Yorks) 88 (121) cases were notified of which 27 (34) were in Sheffield 21 (38) in the Administrative County 13 (19) in Leeds 7 (10) in Bradford In Warwickshire 48 (49) cases were notified of which 29 (38) were in Birmingham Of the 167 (120) cases reported in Lancashire 42 each occurred in Liverpool (27) and Manchester (19) There were 21 deaths from influenza in the 126 Great Towns of England and Wales during the week of these 3 (4) were in Manchester and 2 each in London (6) Liverpool (1) Birmingham (2) and West Bromwich (1) In Scotland 205 cases of primary pneumonia were notified compared with 210 in the previous week there were only 2 cases of influenzal pneumonia—as against 11 in the previous week—and 1 death which occurred in Glasgow In Eire there were 17 cases of pneumonia and 8 deaths 6 (10) of which occurred in Dublin There were 11 (15) deaths from pneumonia in the ten principal towns of Northern Ireland during the week—10 (11) in Belfast and 1 (2) in Londonderry

Measles and Whooping-cough

In the 126 Great Towns there were 14 deaths from measles compared with 12 in the previous week of these 5 (0) were in London 3 (2) in Leeds 2 (1) in Bury and 1 each in Tottenham (2) Portsmouth (0) Kingston upon Hull (0) Liverpool (0) During the week 680 cases were reported from the L C C elementary schools compared with 660 in the previous week The average daily admissions to the L C C fever hospitals were 24 compared with 33 in the previous week and the number of cases of measles under treatment in these hospitals on Friday June 17 was 971 compared with 1 108 on June 10 On the same day there were under treatment in the L C C fever hospitals 984 (1 014) cases of diphtheria 776 (800) cases of scarlet fever 256 (268) cases of whooping-cough Notifications for the week ended June 18 in the eleven metropolitan boroughs in which measles is notifiable were 326 (458) distributed as follows Battersea 18 (39) Bermondsey 7 (15) Finsbury 27 (24) Fulham 30 (61) Greenwich 107 (67) Hampstead 17 (21) Lambeth 40 (32) St Pancras 25 (57) Shoreditch 6 (11) Southwark 12 (12) Stepney 13 (26) In Scotland 258 cases of measles were notified compared with 209 in the previous week the figures for Glasgow were 50 (76) Lanarkshire County 48 (67) Falkirk 41 (35) Dundee 30 (16) Kirkcaldy 3 (21) Edinburgh 16 (29) During the week there were seven deaths from measles in the 16 principal towns of Scotland of these 1 each occurred in Glasgow (1) Dundee (1) Kirkcaldy (0) Hamilton (0) In Eire there was 1 death from measles in Drogheda and in Northern Ireland there was 1 death (in Belfast)

In England and Wales there were 15 (11) deaths from whooping cough during the week of which 5 (0) occurred in London In Scotland 119 cases of whooping cough were notified compared with 56 in the previous week while there was 1 death—in Glasgow In Northern Ireland 7 (17) cases of whooping cough were recorded with 1 death—in Belfast

Cholera

During the week ended June 18 66 cases of cholera were reported at Shanghai and 2 cases with 1 death at Hong Kong In the same week in Burma 8 cases with 8 deaths were notified in Calcutta 7[illegible] cases with [illegible] deaths in Bombay (Presidency) 20 cases with 9 deaths in Delhi 10 cases with deaths So far there have been 17[illegible]0 deaths in the cholera epidemic in the United Provinces of India and [illegible]000 cases reported During the week under review 28 cases with 12 deaths were notified in Cawnpore in the same week in the Punjab there were 180 cases with 96 deaths in Sind 37 cases with 18 deaths and in the Central Provinces 1[illegible]9 cases with 6[illegible]9 deaths In French Indo China during the same week 225 cases of cholera were reported in Annam 519 cases in Tonkin [illegible] cases in Hanoi

Plague

During the week ended June 18 in Burma [illegible] cases of plague with 7 deaths were reported in British India during the same week 3 cases with 5 deaths were notified in Bombay (Presidency) and 2 cases with 1 death in Madras (Presidency) In Shanghai 66 cases were reported during the week under review compared with 84 in the previous week and in Hong Kong 2 cases with 1 death

Small-pox

During the week ended June 18 there were 2 cases of small pox with 8 deaths in Hong Kong In the same week in Burma 26 cases with 5 deaths were reported in Calcutta 45 cases with 40 deaths in Bombay (Presidency) 179 cases with [illegible] deaths in Madras (Presidency) 29 cases with 3 deaths in the Central Provinces 45 cases with 11 deaths in Sind [illegible] with 5 deaths In the same week in French Indo [illegible] cases of small pox were reported in Tonking and [illegible] Haiphong and Hanoi During the week ended [illegible] cases of small pox were notified in the U S A

Typhus

During the week ended [illegible] [illegible] cases of [illegible] were reported in [illegible] [illegible] and in the [illegible] 85 cases were reported [illegible] week ended [illegible] Morocco 170 cases [illegible] were notified [illegible] tributed as follows [illegible] cases 10 cases [illegible] 34 cases [illegible] 2 deaths [illegible] death Oran [illegible] death [illegible] During the [illegible] were [illegible] [illegible] [illegible]

in Algeria 105 (55) cases were reported, mainly distributed as follows Algiers (department) 29 cases Constantine (department) 57 cases and Southern Territories 7 cases In the week ended June 4 in Yugoslavia there were 8 cases of typhus with 1 death In the U S A during the week ended May 21 28 cases were reported Georgia 14 Texas 5 3 each in Alabama and Florida, 1 each in Connecticut Tennessee and Mississippi

Universities and Colleges

UNIVERSITY OF OXFORD

The Professor of Anatomy has recommended that the Welsh Memorial Prize, 1938 for the best set of drawings illustrative of human anatomy be awarded to J L Boldero (Oriel) The drawings submitted by Q J G Hobson (New College) deserve commendation

At a Congregation held on June 23 the following medical degrees were conferred

D M—D A Robertson, F Bicknell
B M—R G Blackledge, S R Gloyne, F G Ethiraj

In Convocation on June 21 a decree was passed accepting a bequest of £2 500 under the will of the late Miss Annie Harrison Symonds, daughter of a distinguished Oxford surgeon for the foundation of a "Horatio Symonds Studentship in Surgery" Mr H P Symonds died in 1923 aged 72

UNIVERSITY OF CAMBRIDGE

Dr R A McCance University Reader in Medicine, has been elected to a Fellowship at Sidney Sussex College

QUERIES AND ANSWERS

Recurrent Ulcers

BORDERER asks for suggestions for the treatment of a girl aged 20 who has suffered from mucous ulcers intermittently for the past four years At first there were only occasional buccal ulcers Now the ulcers appear sporadically and may be buccal anal or vaginal The Wassermann reaction is negative the girl has had all her teeth extracted and examination by a physician and by an oto rhino laryngologist has proved negative Treatment by means of diets with washes tonics and sulphanilamide has had no effect The patient is a domestic servant in a good household and apart from this trouble enjoys perfect health

Alopecia

D MICHAEL MALK (Johannesburg) writes In reply to R J C (*Journal* May 14 p 1084) I had an identical case of alopecia which responded with dramatic success to treatment with 1 gram thyroid tablets three times a day and

℞
Cruse cod liver oil } aa 1 drachm
Liq picis carb
Vaseline ad 1 oz.
To be rubbed into the scalp twice daily

I may add that all the usual remedies had been tried unsuccessfully over a period of several years After eight months of this treatment my patient has to visit his hairdresser twice a month

Operative Treatment of Ascites

Dr D P O BRIEN (Rockhampton Queensland) writes in reply to Perplexed (February 12 p 370) who inquired about the operative treatment of ascites In the *Medical Journal of Australia* of November 26 1927 (p 574) I published a description of an omentopexy different from previous omentopexies This operation unlike other remains efficient for life and leaves no bands round which bowel may strangulate The article describes one case treated in 1912 a man aged 70 It was one of thrombosis of the inferior vena cava and previous to operation tapping was required every three weeks After operation fluid disappeared from the abdomen and no more returned The patient was seen many times afterwards He had no abdominal troubles but secondary veins are to be seen at the back and both sides of the abdomen as well as on the legs reaching down to the ankles The veins now carry on the circulation instead of the inferior vena cava

Medizinische Klinik

Berlin vol 34 April 22, 1938

Importance of Chronic Injury —G Magnus
Recurrent Fractures of the Carpus —E Schneider
Anæsthesia in War Surgery —R Stich
Treatment of Lupus Vulgaris with Scarifications —W Kranz
Early Diagnosis of Urgent Abdominal Affections in Children —A Loeschke

Susceptibility of Young Red Cells to the Merozoites of Avian Plasmodia—R Hegner and Lydia Eskridge

Aldarsone and Human Intestinal Protozoa—Aldarsone is a new pentavalent arsenical—3-amino 4 hydroxy-phenyl arsonic acid It is tolerated by rats dogs, and rabbits, and was tried out in thirty cases of intestinal infections amongst 1 075 inmates of a training school Given in capsules it was effective in eliminating from 33 per cent. to 100 per cent of different (named) protozoal infections in man

Helminths in North Carolina—This is an elaborate analysis of the results of examining 37 346 specimens of faeces, of which 9 5 per cent contained eggs of *Ascaris lumbricoides* with lesser proportions of other helminths The incidence of infestation was three times heavier in negroes (22 5 per cent) than in whites (7 0 per cent)

Bacteriophage—Two rival theories concerning the nature of bacteriophage are (1) that it is a living virus which invades the bacterial cell and (2) that it is a non living substance derived from bacterial metabolism The result of experiments on house flies does not support the theory that bacteriophage is produced by the interaction of host and bacteria

Intestinal Emphysema of Swine—A gaseous distension of the lymphatics of the intestinal wall and mesentery of the pig is produced by a diet deficient in the vitamin B complex, 50 per cent skim milk powder in the mixed ration prevents the occurrence of this condition 20 per cent is ineffective

Basilar Membrane—Previous studies of the width of the basilar membrane had shown a progressive increase in the width from the base to the apex of the cochlea Helmholtz's resonance theory is based on this assumption Wever has reinvestigated this point in serial sections of twenty five human cochleae He finds that the increase in width from base to apex shows wide variations The maximum width is not at the apex but about a half turn before the apical end after which there is a rapid decrease in width The maximum width measurements were 498 microns, the minimum 80 microns

Cholesteatoma—In a series of 303 cases of cholesteatoma Holmes found only one case which was definitely proved to be a primary cholesteatoma Primary cholesteatoma is probably of congenital origin secondary cholesteatoma is a complication of chronic middle ear suppuration and is formed by an ingrowth of epithelium from the deeper part of the meatus Some otologists believe that cholesteatoma is primary in many cases of chronic middle ear suppuration especially if the ear discharge has lasted a comparatively short time—that is not long enough to develop by an ingrowth of epithelium Or the perforation may be in such a position that ingrowth of epithelium is unlikely The author favours the view that primary cholesteatoma is present much more frequently than is generally believed

*Clinical and Pathological Features of Fox-Fordyce Disease.—S. Tappeiner

Arsenical Poisoning of the Skin as an Occupational Disease in Workers in Vineyards.—A. Matras

Bowen's Disease and Keratoma Senile.—Histological investigation in four cases of Bowen's disease showed in two an infiltrative growth in the deep direction which was absent in nine cases of verrucae seniles and five of keratomata. It is concluded that Bowen's disease is carcinomatous from the beginning (carcinosis cutis multiformis verrucosa in Carol's terminology). Darier's teaching concerning dyskeratoses in general is critically reviewed and the term considered inapplicable to Bowen's disease, Paget's disease or molluscum contagiosum although appropriate for Darier's disease—psorospermosis follicularis.

Hydroa Vacciniformis.—The parts played in pathogenesis by photosensitivity, porphyrinuria and impaired hepatic metabolism are discussed. A case is described in which treatment by insulin and dextrose as well as liver extract was successful. From the urine uroporphyrin was isolated as the methyl ester. Vesicles could not be induced by experimental irradiations but *subcutaneous injection of the patient's urine induced* protosensibility in white mice.

Fox-Fordyce disease.—Tappeiner reviews the conception of Schiefferdecker and others of the apocrine glands as atavistic organs (allied to the scent organs of lower mammals and *like them showing some variation with sexual develop*ments and cycles) represented in the human subject in the axilla, nipple, prepuce and labia minora and perhaps in the lips, eyelids and auditory canals. Three cases of Fox-Fordyce disease in females are described, in one the nipples and in one the labia majora were affected and in all a menstrual variation was noted. Deep x-ray therapy is advocated.

*Vascular Lesions in the Brain Stem and Occipital Lobe occurring in Association with Brain Tumours—M T Moore and K Stern
*Observations on the Pathways transmitting the Sensation of Taste—H G Schwartz and G Weddell
Case of Primary Generalized Amyloid Disease with Involvement of the Nerves—S de Navasquez and H A Treble

Normal Disks in Chiasmal Lesions—A study has been made of the site of tumours producing chiasmal lesions in relation to the occurrence of primary optic atrophy. In six cases in which the optic disks were normal the optic nerves ran straight from the optic foramen to the chiasma. Five of these tumours were retro chiasmal and only one was pre chiasmal. It is concluded that pallor of the optic disks is produced by displacement or stretching of the optic nerves and this is more likely to result from a pre chiasmal than a retro chiasmal lesion.

Vascular Lesions and Brain Tumours—Fourteen cases of vascular lesions of the occipital lobe and brain stem occurring in association with distinct space occupying lesions are described clinically and pathologically. In five ischaemic or haemorrhagic infarction was found in the occipital lobe and in ten cases brain stem haemorrhage and in one case brain-stem softening. The brain stem haemorrhages were from the arteries and histologically resembled the haemorrhages in arterial hypertension, they are considered to have a similar origin. Arterial congestion in the basilar artery causes a predisposition to haemorrhages which are finally brought about by a reflex rise in the systemic blood pressure.

Pathways for Taste—As a result of the study of lesions of the trigeminal facial, chorda tympani and superficial petrosal nerves following trigeminal neuralgia and ear operations the authors conclude that in certain individuals taste sensation from the anterior part of the tongue is conducted to the facial nerve via the distal part of the chorda tympani, the optic ganglion, and the great superficial petrosal nerves.

Current Urinary Stone Wave in Central Europe—W Grossmann
Two Cases of Hydatid Disease at the Site of the Prostate—N K B Kimball
Remarkable Accident with a Filiform Guide—K H Watkins

Malignant Testicles—This well illustrated article based on a hundred cases, classifies testicular growths as teratomata (average age 28) and seminomata (average age 40). Clinical varieties are the insidious relentless type, the hurricane type the acute type simulating orchitis, the slow latent-period type and that in which metastases dominate the picture causing pulmonary or gastro intestinal symptoms pain in the back glandular enlargement in neck, axilla, etc. The Aschheim-Zondek reaction helps to distinguish neoplasms from other testicular swellings, to determine the response to radiation therapy and to detect early recurrences (the urinary prolan increasing). Ferguson's quantitative modification of the test seems necessary, since one third of his cases secreted less than 2 000 units per litre an amount which the qualitative test is not delicate enough to detect. The article further deals with diagnosis malignant disease of the retained testicle and the results of its treatment malignancy supervening after orchidopexy or abdominal replacement malignant disease of the epididymis prognosis (much worse with teratomata than with seminomata) and treatment orchidectomy and prophylactic radiotherapy being preferred to the radical operation. Of twenty-four cases so treated 37 5 per cent are alive after four years (50 per cent in the case of seminomata).

Cancer

Brussels vol 13 1936 7

Lipocytomata and Lipocytoses (Lipoblastomata and Lipoblastoses) A Contribution to the Study of Deep Liposarcomata—N Goormaghtigh I Vanderlinden and R De Puysseleyr
*Internal Secretion and Heredity as Factors in the Origin of Cancer—L Loeb
Influence of Protein Intoxication on the Excretion and Properties of Blood Serum—R Reding
Summation of Endogenous Factors in Cancer Patients—F Sinek and L Springer
Experimental Production of Malignant Tumours of the Liver in White Rats by o amidoazotoluol—S Zilberszak

Lipocytomata—The term is applied to deeply situated liposarcomata which are characterized by a tendency to recurrence and which, though less benign than subcutaneous lipomata are not rapidly fatal like other sarcomata. The clinical and pathological features are fully described on the basis of four personal cases and a review of the literature to which 119 references are given.

Hormones and Heredity—While containing no new facts this paper provides a good summary of Loeb's views on the causation of cancer.

Journal of Infectious Diseases

Chicago vol 62 March April 1938

Attenuation and Toxin Production of the Diphtheria Bacillus VI Ultrafiltration of Toxin produced in Peptone-digest Mediums—Augustus Wadsworth Mary W Wheeler and Laura Mendez
*Linkage of Phage induced Characters in *E typhi*—Jeanette D Taranik Jane E Snow
Variation in the Haemolytic Streptococci—M H Dawson G L Hobby and Miriam Olmstead
*Comparison of *Bacterium necrophorum* from Ulcerative Colitis in Man with Strains isolated from Animals—G M Dack L R Dragstedt Robert Johnson and N B McCulloch
Studies of Anaerobic Streptococci from Pulmonary Abscesses—Charles Weiss and Dora G Mercado
Haemolytic Streptococci of Human Faeces—F R Smith and J M Sherman
*Haemolytic Streptococci of Milk—J M Sherman and C F Niven
Studies on Bacterial Nutrition The Possible Role of Inorganic Salts and of Alterations in the Culture Medium in providing Growth promoting Effects—Stewart A Koser R D Finkle A Dorfman and Felix Saunders
Studies on Bacterial Nutrition A Comparative Study of the Growth promoting Properties of Various Substances—Stewart A Koser R D Finkle A Dorfman Mary V Gordon and Felix Saunders
Attempt to Assay the Enterotoxic Substance produced by Staphylococci by Parenteral Injection of Monkeys and Kittens—Ellen Davison G M Dack and W E Cary

Linkage of Phage induced Characters in E typhi—The three environmentally induced characters—namely phage resistance haemolytic power, and agglutinability—are apparently independent variables in *E typhi* cultures with no suggestion of physiological immuno chemical or genetic linkage. If the phage resistant variant is considered as a phage immune bacillus this may have a bearing on current theories of heterophile antigens.

B necrophorum—This is a study undertaken to determine whether one or two species of bacteria are associated with necrosis of the mucous membrane in chronic ulcerative colitis. Nineteen strains were isolated. No clear-cut method for separating *B fundiliforme* and *B necrophorum* was discovered. The authors recommend the retention of the latter name.

Haemolytic Streptococci in Milk—Of 245 samples of pasteurized milk 8 5 per cent showed haemolytic streptococci the common types being *Str durans* and *Str zymogenes*. Of sixty eight samples of raw milk eighteen showed streptococci the prevailing types being *Str mastitidis* and the animal pyogenes.

Treatment of Sciatica—J I Kendrick
Some Observations on Toxic Psychoses—J Tucker

Allergy.—In the series of articles comprising this symposium the phenomenon of allergy in medicine in general is considered. After indicating the importance of this phenomenon the investigation of an allergic case is outlined and then the manifestations of allergy in oto-laryngology and ophthalmology. Gastro-intestinal disturbances bronchitis headache atopic dermatitis asthma hay fever and contact dermatitis are dealt with by recognized authorities. The details of treatment are precise and lucid.

Radiology of the Colon.—An account with illustrations of the more common abnormalities encountered in the examination of the colon by x rays. The technique and value of the double contrast x ray are described. By injecting air after evacuation of the barium enema the coating of barium which remains adherent to the ulcerated mucosa is rendered apparent and the diagnosis of the causative lesion made possible before the ulceration has progressed to produce a filling defect in the wall of the colon.

Public Health Reports

Washington vol 53 April 22 1938

Frequency of Surgical Procedures among 9 000 Families based on Nation-wide Periodic Canvasses 1928-31—Selwyn D Collins
Maternal Mortality Rates by States 1926-36 and Deaths and Death Rates from all Puerperal Causes 1933-6
Public Health Service Publications—*A list of publications issued during the period July to December 1937*
Statistical Matter Weekly list of deaths including data of claims etc from insurance companies prevalence of certain communicable diseases in the United States Foreign and Insular

Frequency of Surgical Procedures.—Records of all surgical operations—*minor and major—were obtained from 8 758* white families in 130 localities in eighteen States for a period of twelve consecutive months and the results were classified. The general rate worked out at 65 per 1 000 somewhat higher for females than for males and highest in the age periods 5–9 years and 30–34 years. Tonsillectomy constituted nearly *one third of all operations* followed by fractures appendicectomy and removal of benign tumours in that order. The frequency increased with the income level and was higher in cities than in rural districts. Of all operations 61 per cent were done in hospital the rest in the office or clinic or at home. The duration of invalidity is discussed at length.

Revue de la Tuberculose

Paris vol 4 March 10

Thoracoscopic Appearances (Contribution to the Study of the Pathogenesis of Pleurisies associated with Pneumothorax)—D Michetti
Skiagram and the Thoracoscope Picture in a Case of Alternating Spontaneous Pneumothorax—A Brekind
Radiological Control on Admission to Several Large Communities—A Feldmann and A Albert
Fall in the Tuberculosis Mortality—D K Rykels
Retarding Action of the Ethyl Esters and of Certain Saturated Fatty Acids and particularly of Ethyl Palmitate on the Evolution of Experimental Tuberculosis—L Negre A Berthelot and J Brees
Selective Reduction by a Thoracoplasty following Pneumoscopy Examination Marking-out of the Adhesion by Tattooing the Zone of Pleural Insertion—R Monod and Leloup
Contribution to Study of Grave Forms of Tuberculosis The Group of Fatal without Remissions—E Bernard B Kreis and M
Technique of Extrapleural Pneumothorax—E Hutchinson and D Foyer
Is Intrabronchial Injection of Lipiodol Always Without Danger—L Kerr
Lobar Dislocation in the Course of Therapeutic Pneumothorax—F Bezançon P Braun and A Meyer

Thoracoscopy.—The author maintains that adhesions have a traumatic action on the visceral and parietal pleura. This causes various degrees of pleural irritation and favours the extension of pulmonary foci and the development of a tuberculous pleurisy. Thoracoscopy shows that in most cases the pleurisy first develops at the level of the adhesions. These should therefore be sectioned within the first few weeks of the induction of the pneumothorax. Delay may mean that the operation will have to be carried out in a pleural cavity that is no longer healthy.

Radiological Control.—The results are given of routine radiological examination of the chest of those seeking admission in France to an important State railway to the prefecture of police and to the civil service. In the first group 24 827 persons were examined and 1·2 per cent rejected. Of *2 066 candidates for the prefecture 0·9 per cent were rejected* but this group consisted of men who had already been police men who had all done military service and who had all been examined previously by *the physician to the prefecture*. Of the 1 891 candidates seeking admission to the civil service 1·6 per cent were rejected. The authors analyse their *findings in detail and discuss the problems that present themselves* in deciding when to reject a candidate on the basis of the radiological appearance of the chest.

Rivista di Patologia Nervosa e Mentale

Florence vol 51 January-February 1938

Contribution to the Knowledge of Experimental Reflex Epilepsy and on the Luminous Stimuli—E Fuchi gnoni
Two Cases of Cerebral Cysticercosis diagnosed during Life—G Canziani and A Nobile
Use of the Centrifuge in the Carrying-out of the Colloid Benzoine Reaction—R Bozzi
Syndrome of Acute Anterior Poliomyelitis in Medullary Syphilis—E. Ferga
Type of Hereditary Tremor—Macrobotulus Multiplex—G Perrus
Observations on a New Method for the Study of the Vascular Network in the Nervous System in Normal and Pathological States—C F zie
Meningiomata of the Anterior Cranial Fossa and their Correspondence with the Median Line A Contribution to the Study as to how far the Determination of the Side of the Lesion is of Precise Diagnostic Value—P Ottonello

Cerebral Cysticercosis.—The authors describe two cases in which the diagnosis was made during life by the discovery of a marked *eosinophilia in the cerebrospinal fluid*. They insist that if a diagnosis is to be made with any confidence the proportion of granular eosinophils should not be less than 1 per cent. The value of this finding is great but is perhaps somewhat lessened by the fact that on rare occasions cerebral cysticercosis may be met with without changes in *the fluid* while very exceptionally eosinophilia may be noted in the cerebrospinal fluid in cases of cerebral syphilis.

Anterior Fossa Meningiomata.—These tumours are of special importance since they lie outside the cerebral tissues exerting their effects by pressure and being essentially amenable to surgical treatment. The occurrence of a bilateral

malignant olfactory meningioma which clinically appeared to be situated in the left half of the anterior cranial fossa gives the author an opportunity to discuss some aspects of the diagnostic problem He stresses the importance of tremor of alterations in the fundus, of the radiographic findings and above all, the most careful study of the encephalograms In the case of the meningiomata of the anterior fossa it may be very difficult to determine whether the tumour is strictly unilateral or implanted on the middle line this should be borne in mind in determining the surgical approach

Strahlentherapie

Berlin vol 61 April 1938

Importance of Spectroscopic Analysis in Biological and Medical Problems—W Gerlach and W Gerlach
Biophysical Explanation of the Action of Light—B Rajewsky
Action of the Visible and Infra red Light on the Skin—G Miescher
Clinical Experience with Carbon arc Light—E Hofmann

Zeitschrift fur Hals-, Nasen- und Ohrenheilkunde

Berlin vol 44 April 30 1938

*What should Ear Nose and Throat Specialists Know of Speech and Voice Therapy?—M Nadoleczny

Vocal Therapy—In a lengthy article which occupies the whole of this issue Nadoleczny surveys the entire field of vocal therapy under various headings development of the voice and speech *mutation disturbances* of the voice at puberty voice defects found in public speakers and singers *laying particular emphasis on* the psychoneurotic element in aetiology, the speech of deaf-mutes and severely deafened persons Nadoleczny describes a method of testing the hearing in very small children—a feat usually considered impossible This is done by means of a musical box and one approaches the child who is occupied with his toys from the back and notes when he turns round to listen to the tune Special chapters are devoted to stuttering and speech defects such as *sigmatism* and nasal speech The article serves as an introduction to a discussion on these subjects at the annual meeting of the German Laryngological Society in June 1938

Zeitschrift fur Orthopadie und ihre Grenzgebiete

Berlin vol 67 March 18 1938

Investigations of Permanent Results of Non operative Reduction of Congenital Dislocation of the Hip—H Gickler and J Meurer
*Early Diagnosis and Early Treatment of So called Congenital Dislocation of the Hip—R Kickelhayn
*Treatment of Flexion Contracture with Subluxation of the Knee joint—E Spira
Para articular Graft Arthrodesis in Tuberculosis of the Ankle joint—J Meurer

Treatment of Congenital Dislocation of the Hip—The German literature dealing with this question is discussed at great length and early treatment is advised The fact that congenital dislocation occurs with much greater frequency in certain German districts than in others is attributed to racial factors Changes in the superior rim of the acetabulum are taken as evidence of a favourable progress after reduction Apposition of bone in that region can occur in the first few *months after reduction* and can be shown radiologically The results of early treatment and possible complications are discussed

Flexion Contracture and Subluxation of the Knee—It is suggested that division of the cruciate ligaments may facilitate correction of this deformity In one case of bilateral subluxation the cruciate ligaments were found to be shortened at operation after division of the ligaments the subluxation could easily be corrected

What More Can You Ask in Heat Therapy?

EVERY comparative test so far published shows that Inductotherm users possess the means of producing more therapeutic heat at greater depth in less time, with greater patient comfort, than those who employ any other form of short-wave therapy. Patients too appreciate Inductothermy because its soothing gentle heat relieves pain quickly. Then in most cases further treatments permanently remove the cause of pain.

The authors of these tests also agree that no other agent gives you Inductothermy's proved high efficiency, safety, power versatility and ease of use. Since both first and afterward these advantages cost no more often less, the question naturally arises: What more can you ask for in heat therapy?

If you want an apparatus for the application of heat wherever it is indicated one whose design is physiologically correct, which operates silently is of distinctive appearance and yet costs less per treatment—*investigate Inductothermy*. We will make this easy to do. Start now by examining the literature. The coupon will bring you that and other important facts about Inductothermy—without obligation.

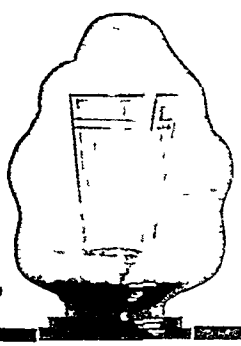
Choose a Spa in

Czechoslovakia

The Spas and Health Resorts of Czechoslovakia with their centuries old tradition of healing reinforced by the experience and researches of local specialists invite your serious consideration



In addition to places of world wide repute such as

PISTANY (Piestany) **CARLSBAD** (Karlovy Vary) **MARIENBAD** (Marianske Lazne) **FRANZENSBAD** (Frantiskovy Lazne)

ST JOACHIMSTHAL (Jáchymov) **TEPLICE-SANOV** (Teplitz Schonau) **LUHACOVICE SLIAC TRENCIANSKE-TEPLICE**

with their medicinal springs and mud baths there are numerous smaller spas and health resorts admirably equipped for the treatment of many diseases including those in the following groups

Anaemia and Chlorosis Basedow's Disease Bronchial Catarrh Constitutional Diseases Scrofula Rickets Digestive Diseases Diseases of the Bladder and Urinary Organs Diseases of the Kidneys Diseases of the Nose and Throat Diseases of Women Disorders of Bones Muscles, and Joints Disorders of the Heart Disorders of Metabolism and Gout Gallstones Leucaemia Nervous Diseases and Post Hemiplegic Conditions Tuberculosis of the Lungs

The arrangements in the bath establishments are up to date in every way the cleanliness and neatness proverbial the service attentive and courteous

It is accepted that a spa cure to be fully beneficial should provide a complete change of surroundings and a break with the patient's normal everyday life

The Czechoslovak Spas fulfil this purpose admirably comfortable hotels first class orchestras and dance bands every facility for sport—tennis golf swimming riding fishing etc

There are also numerous fully up to date homes for convalescence and rest cures

UNIVERSITY OF LONDON

BRITISH POSTGRADUATE MEDICAL SCHOOL

DEPARTMENT OF PATHOLOGY

DIPLOMA IN CLINICAL PATHOLOGY

A COURSE OF STUDY in the academic year 1938-39 will be held for this Diploma commencing on October 3rd. The Course will occupy twelve calendar months. The subjects embraced will be —

HAEMATOLOGY AND CLINICAL PATHOLOGY
PATHOLOGICAL CHEMISTRY
BACTERIOLOGY
MORBID ANATOMY AND HISTOLOGY

The Course will commence with Haematology and Clinical Pathology which will occupy about six weeks and will be followed by the Course in Pathological Chemistry which will occupy about the same time. The Courses in Bacteriology and Morbid Anatomy and Histology will run concurrently and occupy about six months. For the last three months of the Course students will be occupied in the practice of routine work in the laboratories of the Department and in research work. The number of places in the Course is limited and students will be selected shortly before the Course is due to commence.

Fee forty guineas.

In addition to the full Course it will probably be possible to enrol a limited number of students for the subjects of Pathological Chemistry and Clinical Pathology and Haematology separately, the Course in each subject lasting about six weeks. Fee for either Course nine guineas.

Further particulars may be obtained from the Dean, British Postgraduate Medical School, Ducane Road, Shepherd's Bush, London, W.12.

INDIAN MEDICAL SERVICE

RECRUITMENT OF EUROPEAN OFFICERS

Applications are invited from Medical Men for Permanent Commissions in His Majesty's Indian Medical Service. The terms offered include a gratuity of £1,000 on retirement after six years' service, or of £2,500 after 12 years' service together with free return passages for those who no longer desire to remain in the Service. In other respects the terms will be as detailed below.

British subjects of pure European descent who are under 32 years of age who are registered under the Medical Acts in force in Great Britain and Northern Ireland are eligible to apply.

CAREERS

The Indian Medical Service offers a permanent career with wide opportunities of medical experience including clinical preventive specialist and research work. At the beginning of his career an officer is employed on the military side which has medical charge of the Indian Army. Promotion is on a time scale up to the rank of Lieutenant-Colonel and by selection to the ranks of Colonel and Major-General. An officer may apply after one year's Indian Service to have his name registered for transfer to the civil side from which appointments are made to Civil Surgeoncies which are established at the principal civil centres to provide for the medical needs of Civil Officials and for general medical administrative purposes, to specialist (for example public health and bacteriological) services, to research posts and to professorships at the Medical Schools.

23	"	1350	40	1695
24	"	1500	40	1800
25	"	1500	40	1800

Note.—(1) The rupee is at present stabilized at a rate equivalent to 1s. 6d.

(2) An officer promoted to the rank of Lieut.-Colonel before completion of 20 years' service will receive pay at the rate of Rs. 1200 per mensem (basic) plus £40 per month overseas pay.

Extra.—In addition to the above rates various allowances are admissible to a large number of special appointments on both the military and the civil side which may be held by members of the Indian Medical Service. Special high rates of pay are also attached to the numerous administrative appointments open to officers in both branches of the Service.

ANTEDATES IN COMMISSION

Candidates possessing certain higher medical qualifications or holding the Diploma in Public Health may be granted an antedate in their commissions. Past service in certain hospital appointments may also render candidates eligible for an antedate. Persons holding or about to hold resident posts at recognized hospitals may be seconded in those posts for a period. The maximum period of antedate, secondment or antedate and secondment combined admissible under this paragraph is limited to 18 months.

OUTFIT ALLOWANCE.

Officers on appointment will receive an allowance of £70 towards the cost of outfit.

PRIVATE PRACTICE.

With the exception of Administrative Officers, military and civil, and officers holding certain special appointments, officers are not debarred from taking private practice so long as it does not interfere with their proper duties.

LEAVE.

Leave can be taken at reasonable intervals and deductible rates of leave pay are provided. Extra leave (known as study leave) which may not exceed twelve months in all during an officer's service may be granted to officers desirous of pursuing special courses of study of a postgraduate nature. During such leave a study allowance at present fixed at the rate of £1 a day in the United Kingdom, £1 a day on the Continent of Europe and £1 10s. a day in the United States of America and Canada is granted to an officer in addition to ordinary rates of leave pay.

PENSIONS

The rates of pension are as follows:—

	Per annum
After 17 years' service for pension	£372 0s.
" 18 " " "	£400 0s.
" 19 " " "	£428 0s.
" 20 " " "	£465 0
" 21 " " "	£502 0s.
" 22 " " "	£579 10s.
" 23 " " "	£576 10
" 24 " " "	£614 0
" 25 " " "	£651 0s.
" 26 " " "	£697 10s.
" 27 " " "	£744 0

There are additional pensions ranging from £65 to £250 per annum for officers who have held administrative appointments.

PASSAGES

An officer on appointment is provided with free passage to India. The families of officers who are married prior to the date of the officer's embarkation on first appointment will also be provided with free passage to India subject to the payment of messing charge. Officers and their families are also eligible for passage concessions under which they are granted a certain number of return passages home at Government expense during their service.

INSTRUCTION PRIOR TO EMBARKATION

Officers are required to undergo courses of instruction at the Royal Army Medical College and at Aldershot during approximately three months prior to their embarkation for India on first appointment. Information as to the rates of pay admissible during this period and subsequently up to arrival in India is contained in the memorandum referred to below.

A memorandum giving full details regarding these appointments and forms of application may be obtained from the UNDER SECRETARY OF STATE FOR INDIA, MILITARY DEPARTMENT, INDIA OFFICE, LONDON, S.W.1. The Selection Committee will meet at the India Office about July 26th next, and the selected candidates, unless seconded for hospital appointments, will be required to proceed on commencing about September 1st prior to sailing for India in December 1938. Applications should reach the India Office as soon as possible.

INDIA OFFICE, JUNE, 1938.

HIS MAJESTY'S COLONIAL SERVICE

COLONIAL MEDICAL SERVICE.

During 1938, the Secretary of State for the Colonies proposes to select a number of Medical Officers to fill vacancies the majority of which will occur in Tropical Africa and Malaya

QUALIFICATIONS—Candidates must be British subjects of European parentage under 35 years of age and must possess a medical qualification registrable in the United Kingdom Preference will be given to candidates who have held Hospital or Public Health appointments, or who have special knowledge of anaesthetics, radiology, surgery medicine, ophthalmology, gynaecology and midwifery, diseases of the ear, nose and throat venereal diseases, etc

SALARY—Initial salaries vary from £600 to £700 and rise by increments to a maximum of between £1 000 and £1,200

PRIVATE PRACTICE—Private practice is not allowed as of right, but in the case of some appointments it is permitted on certain conditions

QUARTERS—In Tropical Africa free quarters, or an allowance in lieu, are provided In Malaya quarters are provided at an annual rental not exceeding 6% of the officer s salary

PASSAGES—Free first-class passages are provided on first appointment and when proceeding on and returning from leave Assistance is also given towards family passages

TERMS OF APPOINTMENT—The appointments are pensionable, subject to a probationary period which varies from two to three years

COURSES OF INSTRUCTION IN TROPICAL MEDICINE AND HYGIENE.—Selected candidates will normally be required to attend a course of instruction leading to the Diploma in Tropical Medicine and Hygiene before proceeding overseas

DUTIES—Although Medical Officers are appointed in the first instance for general service there are opportunities for work in special branches of medicine and surgery, in public health and in medical research

Further particulars and forms of application may be obtained from the **Director of Recruitment (Colonial Service), 8, Buckingham Gate, London, S W 1**

ROYAL NAVAL MEDICAL SERVICE.

Vacancies exist for Medical Officers in the Royal Navy, and applications are invited for entry in September, 1938

Candidates below the age of 28 years are preferred, and they must be registered under the Medical Acts No examination in professional subjects will be held, but candidates will be required to attend for interview by a Selection Board

Selected candidates will be entered for Service for a period of three years, which if desired is usually extended to five years at the discretion of the Admiralty

At the end of three years' service, officers may retire with a gratuity of £400, but those who serve for five years will receive £1 000

At the end of five years' Short Service, permanent commissions will be given to selected officers who wish to make the Naval Medical Service their permanent career Officers transferred to the permanent list will receive a gratuity of £1,000 (less Income Tax)

Full opportunities exist for transfer to the permanent list, and periods of unemployed or half pay are very rare The assistance of private income is not necessary for the purpose of supplementing official pay and allowances

Opportunities are available for officers on the permanent list for post-graduate study, to specialise, to take higher examinations and to obtain further qualifications

Naval Medical Officers are included in the Scheme for Marriage Allowance under the same conditions as for other Naval Officers

Copies of the regulations for entry and conditions of service, including rates of pay, allowances and retired pay, may be obtained from the Medical Director-General of the Navy, Admiralty, S W 1, and from the Deans of all Medical Schools

Applications for entry from intending candidates must be received not later than 31st August, 1938

Appointments for Medical Officers in the ROYAL AIR FORCE

Medical men are invited to apply for Short Service Commissions in the Royal Air Force. Candidates must be registered under the Medical Acts and be not more than 31 years of age on entry.

The period of service is 3 years—extendible to 5 years. A gratuity of £400 or £1,000 is payable at the termination of 3 or 5 years respectively. Permanent commissions are awarded in a number of cases. There is a pensionable career with the opportunity of extra leave on full pay for specialised study. Applicants who hold—or are likely to hold—post-graduate appointments in civil hospitals may on joining the Royal Air Force be seconded until the termination of their appointments (for a period not exceeding one year). An antedate of commission up to twelve months is allowed for appointments held at approved hospitals.

Fuller information can be obtained from The Director of Medical Services, Air Ministry, Kingsway, London.

APPOINTMENTS—Contd

LONDON JEWISH HOSPITAL
Stepney Green, E.1
(General Hospital—109 Beds.)

The Council of Management are about to appoint an HONORARY ASSISTANT SURGEON to the Ear, Nose and Throat Department. Candidates who should be Fellows of the Royal College of Surgeons of England, Edinburgh or Ireland or Masters of Surgery of a British University, should send twenty-four copies of their application with copies of three recent testimonials to the Secretary of the Hospital from whom particulars of the office may be obtained on or before July 2nd, 1938.

ST. MARY'S HOSPITAL, W.
CASUALTY HOUSE SURGEON

Applications are invited for the above post from duly qualified candidates.

Candidates must have been House Surgeons for a full period of office to this Hospital or to some other General Hospital approved by the Board.

The salary is £100 per annum with board and residence and the appointment is for six months.

Applications with copies of testimonials not exceeding three in number should reach the undersigned (from whom particulars may be obtained) on or before Thursday, June 23rd.

W. PARKES, House Governor.

BOOTLE GENERAL HOSPITAL
Bootle, Liverpool 20
(103 Beds.)

ONE HOUSE PHYSICIAN
TWO HOUSE SURGEONS
ONE CASUALTY OFFICER

Applications are invited for the above posts tenable for six months from October 1st next. The salary attached to each post is £110 per annum with board, residence and laundry.

Applicants must be duly qualified and registered under the Medical Acts.

Applications with copies of testimonials should reach me by Friday, July 15th.

A. J. COOPER,
Secretary Superintendent.

COUNTY OF SOMERSET
APPOINTMENTS OF MEDICAL OFFICER OF HEALTH FOR THE URBAN DISTRICTS OF FROME AND KEYNSHAM AND THE RURAL DISTRICTS OF FROME AND BATHAVON AND ASSISTANT COUNTY MEDICAL OFFICER

Applications are invited from duly qualified Medical Practitioners who are registered in the Medical Register as holders of diplomas in Sanitary Science, Public Health or State Medicine for the above appointments which if made will be held by the same person.

The duties as Assistant County Medical Officer will include school medical inspection and ante-natal clinic work.

The officer appointed will be required to devote his whole time to the duties of the above-mentioned appointments and will be restricted from engaging in private practice as a medical practitioner. He will be required to perform all the duties prescribed by statute or regulation and such other duties as may from time to time be assigned to him by the County Council.

The appointments carry a salary of £500 rising by annual increments of £25 to £900 a year.

Travelling allowance for the use of the officer's motor car will be paid in accordance with the County scale and office accommodation and clerical assistance will be provided.

The successful candidate who must pass a satisfactory medical examination will be required to reside in or near the City of Bath.

Applications stating age, qualifications, diplomas and experience, must be accompanied by copies of not more than three recent testimonials and must be sent to the Clerk of the County Council, County Hall, Taunton, so as to reach him not later than July 15th, 1938, in envelopes endorsed "Deputy Medical Officer."

Further particulars and conditions of appointment may be obtained from the Clerk of the County Council on receipt of a stamped addressed foolscap envelope.

Canvassing directly or indirectly will be deemed a disqualification.

HAROLD KING, Clerk of the Somerset County Council.
H. J. ALLARD, Clerk to the Frome Urban District Council.
W. B. KENT, Clerk to the Frome Rural District Council.
GEORGE R. ASHTON, Clerk to the Keynsham Urban District Council.
R. H. WHITTINGTON, Clerk to the Bathavon Rural District Council.

June, 1938.

THE ROYAL WATERLOO HOSPITAL FOR CHILDREN AND WOMEN
Waterloo Road, S.E.1

HONORARY ASSISTANT PHYSICIAN

There is a vacancy for an Honorary Assistant Physician at the above Hospital. The candidate should be a Fellow or Member of the Royal College of Physicians and a graduate of a University recognized by the General Medical Council. He should also have special knowledge of the diseases of children.

Applications accompanied by three testimonials should be sent to the undersigned from whom further particulars can be obtained, not later than July 15th.

J. H. TEASDALE, Secretary.

ST. PANCRAS DISPENSARY
39 Oakley Square, N.W.1

There is a vacancy for an HONORARY GYNAECOLOGIST who must possess the qualifications and experience appropriate to such a description. The duties will include the conduct of a weekly clinic of two hours for ailing mothers and children. Cases are referred to this clinic from the Welfare Centres in the Borough and in respect of advice and treatment given to such cases a fee of One and a half guineas per session will be paid. Application accompanied by testimonials should reach the Honorary Secretary at the Dispensary not later than Saturday, July 9th, 1938.

THE HARTLEPOOLS HOSPITAL
(95 Beds.)

Applications are invited for the position of HOUSE SURGEON at a salary of £110 per annum plus board, residence and laundry.

Appointment for six months subject to renewal and duties to commence July 15th.

Applications to be made to the undersigned.

NORMAN O. DEANS,
Secretary.

THE CASSEL HOSPITAL FOR FUNCTIONAL NERVOUS DISORDERS
Swaylands, Penshurst, Kent.

LOCUM TENENS (male) required for this Hospital for three months from August 1st. Part time experience essential. Salary £5 5s. a week with board, residence and laundry.

Applications to be sent to the Medical Director, enclosing testimonials, not later than Wednesday, July 13th.

MOUNTAIN ASH URBAN DISTRICT COUNCIL AND EDUCATION COMMITTEE

ASSISTANT MEDICAL OFFICER

Applications are invited from Qualified Female Doctors for the combined post of ASSISTANT MEDICAL OFFICER OF HEALTH and ASSISTANT SCHOOL MEDICAL OFFICER under the Maternity and Child Welfare and Education Committees for the above area. The officer appointed will be required to devote his whole time to the duties of the appointment and will not be allowed to engage in private practice except with the consent of the Council. The duties will include those of Medical Officer to the Day Nurseries and Clinics, and such other duties as may be assigned to him by the Council.

In respect of School Children the duties will be those of an Assistant School Medical Officer under the Director of Education for the County Borough of Rhondda, who is the School Medical Officer, the appointment may be terminated by either party by three months' notice.

The salary will be £[illegible] per annum rising by annual increments of £[illegible] to a maximum of £[illegible] per annum. The salary will be subject to deduction in respect of each half-year during which the officer is absent from duty, except when on duty in connection with the Council's Maternity and Child Welfare Scheme.

Applications stating age, qualifications, and previous experience, should be sent to the undersigned not later than the first post on Saturday, July 9th, 1938.

Canvassing either directly or indirectly will disqualify.

CYRIL E. THATCHER,
Clerk and Solicitor to the Council.

Town Hall, Mountain Ash.
June 9th, 1938.

RESEARCH LABORATORIES

In a building which stands apart from the main manufacturing plant the Parke-Davis Research Laboratories house a staff of scientific workers engaged in the search for new medical knowledge and in the elucidation of problems connected with the treatment of disease.

Each of the separate phases of research work, such as bacteriology, botany, chemistry pharmacology, physiology, pharmacy, etc is supervised by a scientist of specialised training and frequently of national or international reputation Under him is a staff of skilled technicians working with up-to-date equipment in an endeavour to bring to light new knowledge and to explore new avenues in the conquest of disease

This work of research which has been in progress in the Parke-Davis Laboratories for more than half a century, is not controlled by time schedule or calendar—often many months and even years are spent in the solution of a problem and the only stipulation is that the work shall be done conscientiously and well

JUST READY!—Andrews on the Skin

The New (*2nd*) *Edition* of Dr George C Andrews' book on Diseases of the Skin is *just off the press*. Not a page escaped revision. New material has been added to every chapter. *75 diseases* are discussed for the first time while the very latest applications of tests, diagnostic procedures and the newest approved therapy are given in the fullest detail.

Dr Andrews first takes up those subjects of more general nature devoting separate chapters to anatomy, pathology, symptomatology, general diagnosis, roentgen therapy, radium therapy and surgical diathermy. Then he describes individually the various diseases and conditions, with specific emphasis on the clinical aspects and the measures of treatment indicated. You will find full discussions of industrial dermatitis, drug dermatitis, eczema, pruritus, tuberculosis of the skin, diseases caused by filterable viruses, diseases of hair and skin appendages, neoplasms of the skin, and a monographic presentation of *syphilis* that covers *119 pages*.

Dr Andrews gives you *over 100 actual prescriptions*. He tells you just what the patient should eat as well as what he should not eat. He tells you how to use the *new therapeutic agents* such as sulphanilamide, fever therapy, diathermy, malaria therapy, etc., etc. He calls important points to your attention by the use of italic type, gives the skin manifestations of other diseases, stresses the importance of prophylaxis. There are 958 illustrations that constitute a veritable atlas.

By GEORGE CLINTON ANDREWS, A.B., M.D., Associate Professor of Dermatology, College of Physicians and Surgeons, Columbia University. Octavo of 899 pages, with 958 Illustrations. Cloth, 45s. net.

PRACTICE OF UROLOGY

By LEON HERMAN, B.S., M.D., Professor of Urology, University of Pennsylvania, Graduate School of Medicine. Octavo of 925 pages, with 756 Illustrations on 504 figures. Cloth, 45s. net.

Dr Herman's work is exactly what he intends it to be—a practical treatise of diseases of the urogenital system, for the use of general practitioners and surgeons. The subject matter is skilfully arranged, and the text is well illustrated.—THE LANCET

PRACTICAL PROCTOLOGY

By LOUIS A. BUIE, A.B., M.D., F.A.C.S., Head of Section on Proctology, the Mayo Clinic, Professor of Proctology, the Mayo Foundation. Octavo of 512 pages, with 152 Illustrations, including 6 in colours. Cloth, 30s. net.

justifies its title up to the hilt. It is above all practical. It writes in a simple and attractive manner, and covers the whole field of proctology in such a way that even a beginner can have no excuse for blunders in diagnosis and treatment. The book is confidently recommended as a stimulating and beautifully produced work in the field of proctology.—SOUTH AFRICAN MEDICAL JOURNAL.

PRE- AND POST-OPERATIVE TREATMENT

By ROBERT L. MASON, A.B., M.D., F.A.C.S., Assistant in Surgery at the Massachusetts General Hospital. Octavo of 495 pages, Illustrated. Cloth, 25s. net.

gathers together a considerable amount of very useful information and presents it in an arresting and entertaining manner. It will appeal to the house surgeon requiring help in a specific case, and will make a useful addition to the library of a surgeon.—EDINBURGH MEDICAL JOURNAL.

THE LARYNX AND ITS DISEASES

By CHEVALIER JACKSON, M.D., Sc.D., LL.D., F.A.C.S., and CHEVALIER L. JACKSON, A.B., M.D., M.Sc.(Med.), F.A.C.S. 555 pages, 221 Illustrations, 11 Plates in Colour. Cloth, 35s. net.

From the accepted masters of bronchoscopy and oesophagoscopy we expected really outstanding book on the larynx, nor are we disappointed. The book is more than complete, and also [illegible] rarer laryngeal troubles and at every point [illegible] all the rarer conditions.—IRISH JOURNAL OF MEDICAL SCIENCE.

W. B. SAUNDERS COMPANY, Ltd., 7, Grape Street, London, W.C.2

INFLUENZA

In A Study of Epidemic Influenza the Medical Research Council presents results of correlated clinical and laboratory studies undertaken during the epidemics of influenza and influenza-like diseases in 1936 and 1937. Influenza due to virus infection can be distinguished from febrile catarrh by laboratory methods; the present work shows how far such a distinction can be made from the symptoms and signs. The question is an important one in view of the possibility of prophylaxis and serum treatment. No. 228. 2s. 6d. (2s. 9d.)

EPIDEMICS IN SCHOOLS

School communities offer somewhat special facilities for the investigation of epidemic and other illnesses, and the Medical Research Council has now made available a careful study based on data collected over five years which throws a great deal of light on the problem of school infections generally, and points to the important problems still unsolved and indicates how they may best be tackled. No. 227. 4s. 6d. (4s. 11d.)

SYPHILIS

An Analysis of the Results of Treatment of Early Latent and Muco-cutaneous Tertiary Syphilis is a study of 570 cases treated at Glasgow between 1919 and 1932. By following up over this long period cases of syphilis which had received a standard course of treatment, and of which the diagnosis had depended on constant methods, it was possible to see in their proper perspective the conditions which allowed the maximum amount of success, and those which were followed by comparative failure. No. 224. 2s. (2s. 2d.)

THE CHEMISTRY OF ANTIGENS AND ANTIBODIES

This report by J. R. Marrack replaces an earlier one with the same title (No. 194) of which it is in extensively revised edition. It includes the more important results of recent experimental work, and the subject is reviewed in the light of present-day knowledge of molecular structure. No. 230. 3s. (3s. 4d.)

CARDIAC ENLARGEMENT

The Development of Cardiac Enlargement in Diseases of the Heart is a record of cases selected to show the ultimate effects upon the heart's size of such major events as persistently increased heart-rate, high blood-pressure, congestive failure, and coronary thrombosis. The grouped descriptions of cases should have permanent value in providing for reference direct examples and clear details of changes of the heart's size in many different types of patient. 1s. (1s. 2d.)

HM STATIONERY OFFICE

[illegible]

For those Cases where

SPECIALISED FOOTWEAR

is Indicated...

For normal and abnormal foot cases Hardy's MASTAFIT footwear supplies a much-needed service. No longer is it necessary to make the bulk of such shoes to measure; for MASTAFIT shoes are stocked in several different foot formations on the principle that every foot type needs its own particular shoe. Medical men are invited to call and test the system in operation. A pair of shoes (please state size) and booklet will be gladly sent for inspection on request.

THESE 3 ESSENTIALS

are assured only when a support is *individually designed* for patient

1 WEIGHT OF SUPPORT ON PELVIC GIRDLE

Each Spencer is designed to place the weight of the abdominal support on the pelvic girdle—NEVER on the spine at or above the lumbar region

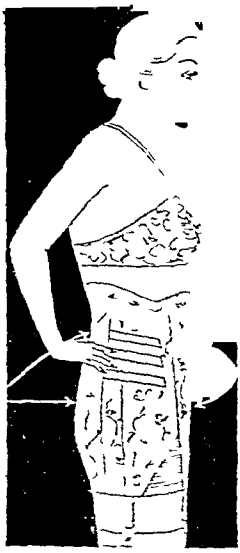
To be helpful to the Doctor in his treatment a support must

1 **Place the weight of support on the pelvic girdle—never on the spine at or above the lumbar region**

2 **Provide gentle abdominal uplift without compression**

3 **Guide the figure into improved posture**

Spencer Supports assure these three essentials because each Spencer is individually designed cut and made to meet the particular needs of the one patient who is to wear it



Spencers are light in weight flexible easily laundered and guaranteed NEVER to lose their shape They are made of non-stretchable fabric —not elastic (A support that stretches loses its shape and its efficiency to control)

Spencer Supports are individually designed for Hernia Sacro-iliac Strain, Enteroptosis Movable Kidney Pregnancy and Postpartum Breast Conditions

Let a trained Spencer Corsetiere call at your surgery or arrange an appointment to suit your convenience

Spencer Supports and Corsets are never sold in shops

Trained Spencer Corsetieres are resident throughout the Kingdom Name of nearest stockist supplied on request

2 ABDOMINAL UPLIFT WITHOUT COMPRESSION

Insurance the [illegible] assurance [illegible] with [illegible] Attention [illegible] to any [illegible] from the specific support to [illegible] for

BEWARE OF SUBSTITUTION — Spencer Corsets Ltd regret the necessity of warning the medical profession that in several instances where doctors have specifically prescribed a Spencer Support a corset of another make has been substituted, and because its makers do not understand the Spencer principles of individual designing has been unsatisfactory Every genuine Spencer Support bears the SPENCER Label

3 POSTURE IMPROVEMENT

Spencers are designed to improve posture Spencer Individually Designed Support which provides abdominal support and uplift without back strain guides the body into improved posture

LACTOFLAVINE B.D.H.

(*Vitamin B_2*)

The separation of the three components of the Vitamin B_2 complex was quickly followed by the establishment of nicotinic acid and its amide as specific in pellagra, these substances being closely related to, if not identical with, the pellagra-preventing factor itself

Lactoflavine, another component of the complex, has not been investigated so completely, but sufficient information is available to justify its use (collaterally with other forms of treatment) in various types of anæmia, in cyanotic conditions, cataract and, possibly, in cases of sterility of uncertain origin

Lactoflavine B D H is available in ampoules of sterile solution for intramuscular or subcutaneous injection

THE BRITISH DRUG HOUSES LTD LONDON N1

Telephone Clerkenwell 3000 Telegrams Tetradome Telex London

Lac S/1

or two cases there was an increase in the depression when the effect of the drug was wearing off, and it is important to bear in mind that Davidoff and Reifenstein mention a case of manic-depressive illness in which the patient impulsively attempted suicide One of our patients (the alcoholic depressive) became very much more depressed, and the question of suicide was uppermost in our minds for some days, and in another (C 5) the depression was considerably intensified This might, of course, just as well have been a usual constitutional intensification in the first case, but it appeared to be a definite effect of the drug in the second

Comment

It must be admitted that, so far at least as these results are concerned, it is difficult to claim any great therapeutic value from benzedrine Nevertheless, if its use relieves the depressed patient even transiently and gives him a few hours respite, the drug has a place in psychiatry To claim more than this from it at the moment, however, is impossible, and there are many limitations to its usefulness, not the least of which is the variability of its action A small minority of cases seem to benefit definitely from benzedrine, and its greatest usefulness perhaps is in those cases of depression in which a clinical improvement has already set in Here it may be helpful in giving the patient a temporarily increased insight, which has been of use psychotherapeutically Apart from this, the drug is of doubtful value as an aid to psychotherapy It was difficult to resist the impression in one or two cases that the speed of convalescence from a depression was increased, but this is difficult, if not impossible, to establish objectively Indeed it is almost impossible in many cases to separate the changes of the normal process of recovery from the effect of the drug, which makes any pronouncement of its value in such cases very dubious For those patients who have clinically improved but who for economic or other reasons are unable to stay in hospital and must return to work, benzedrine is sometimes of help in enabling them to face their day's work The drug should, however, be controlled by frequent examination of the patient afterwards For those depressed patients who may at any time get worse and perhaps contemplate suicide, suitable doses of benzedrine may enable one to keep them in a hospital or even in everyday life without extra supervision Here, again, they should not be given a bottle of tablets and allowed to go their way

With regard to dosage, 10 to 40 mg in ordinary cases should be enough, and a divided dosage—say, 15 mg at 9 a.m and a further 15 mg at 11.30 a.m—is to be recommended, and certainly, unless the patient is under full in-patient supervision, this dosage should never be exceeded The drug is admittedly still in its experimental stage, but enough work has now been done to make it doubtful how far, if at all, it is likely to be of greater value in psychiatry than it is at present The contraindications are now being established but from my experience it would appear to be unwise to give benzedrine to any subject with cardiovascular disease in any form, or to those with prominent anxiety symptoms The initial dose should not exceed 10 mg and the optimum dose should be determined carefully I agree with Davidoff and Reifenstein that it should be used cautiously in certain depressives because of the possibility of intensifying the depression with consequent suicidal risk This risk has not been sufficiently stressed

Summary

Thirty-three patients suffering from different forms of mental disorder and eight normal subjects were given benzedrine orally in doses of from 5 to 45 mg In sixteen the drug had to be discontinued because of untoward effects, mental or physical, and in two more because no beneficial effect was produced In eleven (one-third) the drug appeared to be helpful In five no effect mental or physical, was produced Dosage, contraindications, and the general value of benzedrine in psychiatry are discussed

I should like to thank my colleague Dr W C M Scott for having furnished me with his observations on several patients in this series and some of the controls, and also for much valuable help in the preparation of this paper

I would like also to thank Messrs Menley and James the distributors, for supplying me with a generous supply of the drug with which to carry on this work

THE USE OF PLACENTAL EXTRACT IN AN EPIDEMIC OF MEASLES

BY

T N PARISH, M A , M D ,

Medical Officer to Benenden School

This is an account of an epidemic of measles in a girls school in which placental extract was used as a prophylactic

The girls vary in age from 13 to 17 years There had been no such epidemic in the school for nine years and at the beginning of the Easter term 1938 of the 205 girls under my care eighty nine had not had measles On January 18 a few hours after the return to school one child was found to be in the incubation stage of measles She came by the school train and school bus so that contacts were widely spread throughout the school Prophylactic measures were discussed and in view of the difficulty of obtaining convalescent serum it was decided to use placental extract in an attempt to modify the subsequent attacks and to lower the complication rate Moeller (1937) maintains that this extract is as efficacious as convalescent serum and of greater prophylactic value than adult serum Parents were circularized and forty-seven asked that their children should be given the injection some of them requesting that this should be done at once When the time of injection was left to our discretion the injection was given as soon as a case occurred in either the girl s house or form All were given between January 27 and February 16 The term ended on April 3

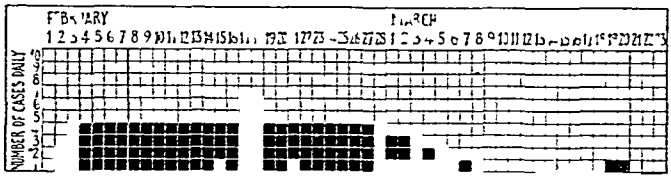

FIG 1 —Unmodified cases (6)

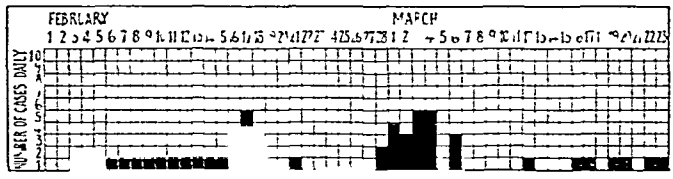

FIG 2 —Modified cases (44)

Dose and Reactions

The extract used was Lederle s immune globulin, and it was given in one intramuscular injection of 4 c cm into the buttock There were no immediate reactions but after a few hours stiffness and some pain at the site of injection were usual The stiffness persisted for about two days One child had a temperature for twelve hours but in no case was there constitutional disturbance of any severity nor did any delayed reactions occur

Course of the Epidemic

The case incidence throughout the term after the initial infecting case (which is not included in these statistics) is given in Figs 1 and 2 Fig 1 shows the day of onset of rash in the unmodified cases and Fig 2 the day of onset in the modified cases

Taking into consideration the larger number of cases in which the prophylactic injection had been given it does not appear that the extract had any effect in delaying the onset of the attack

By the end of the term seventy five of the eighty nine susceptibles had developed measles as well as five of the 116 said to have had measles previously of whom two had also received a prophylactic injection The distribution of cases in the modified and unmodified groups is shown in Table I

TABLE I —*Incidence of Measles*

	Previous Measles (116 Cases)		Susceptible (89 Cases)	
	Modified (2 Cases)	Unmodified (114 Cases)	Modified (56 Cases)	Unmodified (33 Cases)
Measles developed	2	3	53	33
No measles	0	111	3	11

It is obvious that the extract had no effect whatsoever in preventing the attack of measles On the contrary the above figures show that among the susceptible cases measles developed in 93 per cent of those who had been given the modifying injection and in only 75 per cent of those who had not The two children who had previously had measles and who had also been injected both developed measles

The epidemic was of moderate severity although there was a most remarkable freedom from serious complications Temperatures of over 103 were present in 66 per cent of the total cases The only complication of any severity was one case of suppurative otitis media

Effect of Extract on Attack

The effects of the prophylactic injections were much more noticeable in the first half of the term It is not possible to convey a clinical impression by statistics but the impression received by all observers was that those cases in which the attack developed within three to four weeks of the injection suffered far less constitutional disturbance A few of these showed a slight rash of small discrete papules with no tendency to coalesce but on the whole little difference was observed in the rashes of the modified and unmodified cases The most noticeable feature of the recently modified cases was that although the temperature was high and a well developed rash was present the patient remained surprisingly cheerful and undisturbed, and did not present the typical woebegone facies and prostration

The cases were classified (Table II) as they occurred as mild moderate or severe this classification being based on the degree of constitutional disturbance This is necessarily a somewhat arbitrary classification for the degree of disturbance did not appear to have any relation to the temperature or nature of the rash

The effect of the extract in reducing the severity of the attack is most noticeable in those cases in which it had been given within three weeks of onset of rash

TABLE II—*Type of Attack*

	Total Cases	Mild	Moderate	Severe
Unmodified	36	17%	78%	5%
Modified	44	50%	45.5%	4.5%
Modified within 3 weeks of onset	19	74%	26%	—

Table III contrasts the behaviour during the attack, of the unmodified cases with that of the total modified cases, and with those cases in which the extract was given within three weeks of the onset of the rash

TABLE III—*Course of Attack*

	Koplik's Spots	Days under Observation Before Onset of Rash	Days Temperature After Onset of Rash	Temperature over 103°
Unmodified	61%	2.6	3.4	72%
Modified	36%	2.8	2.6	61%
Modified within 3 weeks of onset	26%	2.5	2.0	74%

The most noticeable features of this table are the lowering in incidence of Koplik's spots and the quicker fall in temperature after the onset of the rash in modified cases. Both these features are more marked in the recently modified cases. The temperature of the recently modified cases is noticeably high, which is anomalous in comparison with the other results, but may be related to the apparent increase in susceptibility following injection of extract.

Complications

Apart from the one complication of bilateral suppurative otitis media, there were no serious complications. The complications given in Table IV are chiefly accounted for by the persistence of what may be regarded as normal concomitants of measles. Apart from the one case of suppurative otitis media in which paracentesis was performed, all cases of otitis were of the catarrhal type.

TABLE IV—*Complications*

	Total Cases	No. Complicated Cases per Cent	Acute Conjunctivitis	Styes	Persistent Nasal Catarrh	Sinusitis	Laryngitis	Persistent Bronchitis	Otitis Media	Total Complications per Cent
Unmodified	36	61	8	2	3	1	—	8	5	75
Modified	44	25	1	1	2	1	2	3	5	34
Modified within 3 weeks	19	5	—	—	—	—	—	—	1	5

There is a remarkable freedom from complications in the modified cases. The one complication in the recently modified cases was the case of suppurative otitis media and this occurred in a child who had previously suffered from bilateral otitis media and mastoiditis, and who had received her injection only eight days before the onset of the rash.

Discussion

The great defect in prophylaxis of measles whether by convalescent or adult serum or by placental extract, is the difficulty in estimating when exposure has been intimate enough to ensure subsequent development of an attack. In a large girls' school there are many opportunities for contact with cases in the incubation stage, but these contacts may be brief and not sufficient to produce an attack.

It was unfortunate that the epidemic started so soon in the term, for it seems probable, from a study of other reports (McKhann, 1937) and from the results obtained during this epidemic, *that the passive immunity* conferred is of short duration and that immunity decreases rapidly after three weeks.

By mid-term it is probable that most of the immunity conferred by the placental extract had vanished. Fortunately it does not appear that the extract in the doses given prevented or delayed the development of measles. Crosbie (1938) found that 4 c.cm. of placental extract was not always sufficient to ensure a modified attack, although it did prevent complications and sequelae. It is probable that if a dose larger than 4 c.cm. had been given *in this epidemic the immediate modifying effect* would have been more pronounced but there would then have been a greater risk of postponing the peak of the epidemic until later in the term, by which time the modifying power would have been greatly diminished. In a school epidemic it seems wiser to recommend for "modification" a dose which may in some instances fail to modify, although preventing complications, for such a dose will be less likely to bring about complete prevention.

There was a remarkable freedom from serious complications in the epidemic, and this renders the estimation of the value of the extract in reducing the complication rate less conclusive. If however, by the use of the extract, the reduction obtained in the number of somewhat trivial complications may be taken as an indication of its power in preventing major complications in some less fortunate epidemic, then the value of the extract is undoubted.

Apart from deliberate exposure of susceptible cases with a coincident modifying injection, the ideal course to adopt in an epidemic would be to immunize susceptible cases at intervals of three weeks until an attack developed. This would involve considerable inconvenience and expense, and in an epidemic of the type described, in which serious complications were absent from the start, it does not seem justifiable to advise this procedure.

Summary

An epidemic of measles in a girls' school is described in which placental extract was used in an endeavour to reduce the severity of the attack and the subsequent complications. There were no serious reactions following the injections. The extract did not have the effect of preventing or postponing the attack. It rendered the attack milder, the duration of temperature shorter and lessened the subsequent complications. It is probable that the immunity conferred diminishes fairly rapidly after three weeks.

A WOMAN BLIND FROM BIRTH WHO ACQUIRED SIGHT AT 22 YEARS OF AGE

BY

R COLLEY, M B, Ch B, D O M S

Honorary Ophthalmic Surgeon Royal United Hospital Bath Senior Honorary Surgeon Bath Eye Infirmary

Very few cases have been reported of a person who blind from birth has obtained sight in adult life I have been able to find records of only four cases although I have no doubt more may have been published

I saw this girl for the first time on March 8 1932 She had been blind from birth as a result of congenital cataract and had been educated at a blind school from 10 to 19 years of age No operation on the eyes had been performed

Condition of Eyes before Operation

On March 8 1932 she could distinguish light from darkness with each eye and could tell when an object was moved in front of her face especially if a bright light was behind the object The projection of light of both eyes was good They exhibited marked nystagmoid move ments best described as shuddering There was con vergent strabismus possibly the right eye being the one more usually turned in Both lenses were completely opaque Slight epiphora was present the lacrimal sacs having been removed during childhood There was no history of blindness in the family and she was the only blind member out of seven children

Condition when Blind

Before the operations she was a totally blind person earning her living as such She was unable to get about without assistance and had to be led when not in her own home except for the fact that she used occasionally to visit a friend's house and a shop about two minutes distance to reach which it was not necessary for her to cross a street She had never seen a human face a flower a motor car or anything which a sighted person takes for granted All her ideas about the world had been obtained from reading braille from information given to her by others and by the use of her other senses She had scarcely any preconceived ideas of things which she could not feel When reading in braille she took no interest in the description of things or places but only what people said and did

The other senses were well developed She had very acute hearing—better than the other members of her family Similarly her senses of smell and touch were very good She says she was unable to detect the presence of a person in a room if he kept absolutely still but could recognize members of her family by their cough the way they walked etc

While at the blind school she had learnt braille which she can read fluently She had been taught machine knitting and chair seating as well as the ordinary school subjects—English history geography music and arith metic up to fractions and decimals etc She was very happy while at the blind school as being with blind people she did not realize any disability but on returning home she felt her position in comparison with those with sight After leaving the school she worked at home at knitting and chair seating She came to consult me in the hope that something could be done for her

Operative Measures

Both lenses were needled several times and a corneo evacuation was performed on the right Later the cap sules were needled

CONDITION ON DECEMBER 8 1932

Right eye Vision with − 15 D sph and − 1 D cyl axis 60 = 3 60 add + 4 D sph reads J 12 with diffi culty Left eye Vision with − 16 D sph and − 1 D cyl axis 135 = 6 60 and + 4 D sph reads J 5 Both media are clear and the fundi appear normal Horizontal nystagmus is present in both eyes but far less marked than before the operation The axis of the eyes is usually parallel but occasionally one eye usually the right is turned in

On account of the type of the operations performed her vision returned only very slowly—from appreciation of light through blurred vision eventually to seeing things reasonably well with the aid of glasses Having built up a world of her own it is very difficult to appreciate her thoughts on being presented with the sight of the ordinary things of life

Psychological Observations after Operations

PERCEPTION

On gradually obtaining her sight the first thing she noticed was a white apron worn by a nurse then the red colour of a dress Next she saw a window and a door way The window had no shape but appeared as a bright area and the sky white Later she saw her hands and fingers but could not distinguish her nails After this she saw chairs and tables Then she saw a face The second colour she noticed was green and the other colours later She had to be told the name of each colour Even now she has difficulty with some of the different shades

When she first saw a building it appeared a dark object with no shape After she got her glasses buildings looked huge but she had no preconceived idea of their shape or the appearance of the different types She did not recog nize a church although she knew that it had a tower or steeple but this did not convey anything to her She had read descriptions of different things but did not appreciate what they were going to look like

At first she had no estimation at all of distance and could not judge the position of objects in relation to herself Cars seemed to be coming straight at her and people appeared to be walking into her She still occa sionally thinks a car is coming straight at her but she can cross roads and is usually able to tell how far away a car is and whether it is safe to cross In going upstairs she could not judge the height of steps and sometimes raised her foot too high She fell both when going upstairs and when coming down Even now if stone steps are wet she has some difficulty When blind she did not bump into a door but when she first relied on her sight she did so—similarly with tables and chairs She could see the door way but had no idea of its relation to herself she could not tell how far away it was Now however she has no difficulty in avoiding objects

At first she had no appreciation of solid objects prob ably the outline only being seen She had no perception of form She thinks that at first she could not have told a brick from a ball except by touch but is able to do so now and she can also appreciate depth and can distin guish a solid object from a flat one Also in the blind state she had no knowledge of the relative size of different

things and on seeing objects such as houses for the first time they looked enormous She thought some animals were much larger than she found them to be when she went to the Zoo She had imagined that bears were as large as elephants and the latter much larger still Cats and dogs did not appear larger than she expected probably because she had touched them when blind She knew that dogs were of different sizes Looking at a cat and a dog of the same size she could not distinguish one from the other unless the dog barked, but she could do so quite easily by touch Objects which she could feel she was able to recognize, and thus learn to know by sight

She is intelligent and has a good memory She has asked many questions and on being told what things were she has remembered Looking out of the window at the Bath Eye Infirmary she saw an object going up the road outside She knew it was some kind of motor vehicle as she had previously seen cars but this was different On describing it to another patient she was told that it was a motor van Similarly with all the objects she saw—she had to learn what they were

Faces at first looked alike but she is now able to distinguish one from another She was greatly disappointed with faces, as she said she had thought all people were beautiful and had "happy-looking faces In looking at a print or photograph she has difficulty in telling the foreground from the background Coloured pictures at first appeared just a mass of colour, but now she is able to a large extent to make out the subject of the picture She likes bright things and thinks flowers are beautiful

She is a fluent braille reader but of course did not recognize the ordinary printed word or figures and had to learn the ordinary alphabet and figures before she could read the printed and written word

As she did not understand what she was looking at she made progress by (1) asking questions (2) recognizing things by touch and then by sight (3) recognizing things by smell and touch—for example the different flowers, where of course colour helped (4) recognizing things by knowing what she had read or been told

VISUALIZING ASSOCIATION ETC

She had no visual images until she obtained her glasses The association of ideas in a person who has never seen are by sound—including sound of words—touch and smell Thought in the blind state is mainly word thinking but in the sighted it is mainly picture thinking Her association of ideas is now that of a sighted person—that is dependent on visual images She is able to describe objects which she has seen earlier

At first she was very depressed and wept a lot—in fact, she must have gone through a great emotional strain Probably she had not realized that she would have to learn all about visible objects and more or less start again at the beginning She was so to speak between two worlds Eventually, as time went on she gained confidence as her vision improved and her sighted knowledge increased

On March 30 1936 she obtained a post at a factory, starting at 10s a week After three months her wage was raised to 12s at six months to 14s, and at a year to 16s Now she is earning 19s a week Normally a girl leaving school starts at the age of 14 years at 10s a week, rising to 18s at 16

Before the operations she had to be brought from her home to see me in Bath but now she can find the way herself, travelling by bus and walking to the Eye Infirmary She has joined the local company of rangers, and does the ordinary field work and plays games, but has difficulty in catching a ball She can do general housework, dusting polishing floors and making beds, and when washing up does not break more things than a sighted person She has not yet done any cooking She goes to the cinema, and on her holidays enjoys sea-bathing She watches her friends playing tennis but cannot play herself as she cannot hit a ball with a racket Although she can write well and read the printed word she still finds it quicker to read braille She has also visited London—seen Madame Tussaud's the Zoo, and the theatres, etc

More detailed psychological studies are being undertaken, and will be published later There seems no doubt that at least in the case of a person of the intelligence of the present one, it is possible for a previously blind person to make a fresh start in life as a sighted person, though in some of the cases described this has proved too hard a task

MOULDS AND ASTHMA

BY

E. M. FRAENKEL, M.D.

Voluntary worker at the L.C.C. Southern Group Laboratory, Park Hospital, London, S.E.

In a previous communication (1934) I published a list of allergens which had given rise to positive skin reactions in 522 cases of asthma observed by me in Germany Of these patients 290 were males and 232 females The reactions most often obtained were those given by extracts of house dust, bed feathers, and mattress stuffing The next most frequent reactions in this series were those obtained from bacteria (108, 20·7 per cent) and moulds (84 16·1 per cent) This latter figure is almost identical with Hansen's figure of 15 per cent given in his record of asthma cases in Germany

Storm van Leeuwen was the first to suggest that moulds, especially *Aspergillus fumigatus* mucor, and penicillium, play a part as "miasms" in (*a*) climatic or (*b*) house allergens In my own observations the patients were usually tested with aspergillus, penicillium, and mucor extracts, the original cultures being made from the residence of asthmatic patients

More recently a number of papers have been published in the United States on the problem of moulds as a cause of asthma and hay-fever Some of these investigations deal with mould extracts as supplied by the Arlington Chemical Company, who made preparations of four types of aspergillus, and one type each of alternaria, chaetomium, monilia, mucor, and penicillium, in all, nine different types With these extracts Lamson and Rogers (1936) working in Los Angeles, found that of 1,259 patients tested 154 gave positive skin reactions (12·2 per cent) Of these sixty-six were positive towards alternaria twenty-four to chaetomium, twelve to *Aspergillus fumigatus* and fifty-two to others On the other hand Balyeat (1932) who carried out his investigations in Oklahoma found that only 1 per cent of 480 patients gave reactions towards moulds Feinberg (1935), working in Chicago, found that sixty-eight patients out of a total

of 243 (28 per cent) gave positive reactions towards one or more of several fungi

Schonwald (1938) on the other hand reports from Seattle that out of a total of 150 patients 77 per cent gave positive skin tests to one or the other of ten types of moulds Reactions were obtained most frequently with *Penicillium expansum* (77 per cent) *Trichoderma kerningi* (72 per cent) *Alternaria tenuis* (70 per cent) and *Aspergillus niger* (68 6 per cent) and were procured by means of scratches and intradermal reactions The latter were of course comparatively the most frequent

Brown (1936) tried sixty eight different types of moulds and yeasts in twenty-four cases He found that twelve cases were sensitive to saccharomyces and six to alternaria compared with four who were sensitive towards aspergillus Prince *et al* (1937) tested twenty nine different moulds in eighteen individuals in Texas obtaining eleven positive reactions of which he considered eight to be significant Feinberg (1935) has pointed out that apart from moulds yeasts gave positive results in about 11 per cent of the total number of cases tested It has also recently been established by Wagner and Rackemann (1937) that old kapok which had been subjected to the action of moulds produced certain allergens to which patients were sensitive when they were not sensitive towards either the kapok itself or the mould alone This indicates that not only are the moulds themselves a source of allergic reactions, but that these are produced in addition, by some products of the action of moulds on other materials

The great variation in the frequency of mould reactions in allergic patients apparent in different parts of the United States is explained by differences in the climate and the resulting frequency of the occurrence of mould spores in the atmosphere The incidence of air borne fungus spores varies in different places according to the humidity and other climatic factors It has been pointed out by Schonwald (1938) that there is a far more abundant growth of moulds in Seattle with an average morning humidity of 85 per cent and evening humidity of 51 per cent, than 300 miles inland where the average humidities are 42 per cent and 27 per cent respectively These facts explain the great part played by moulds in the aetiology of asthma in this district of the United States this is also proved by the success of desensitization treatment with mould extracts in eighty six patients

In hay fever and in asthma the mould spore is an important factor because of its abundance in the atmosphere and because being much smaller than grass pollen it is more easily inhaled and absorbed This has been pointed out by Durham (1937) who working in Chicago found that there are more alternaria spores in the atmosphere than there are particles of rag weed pollen Observations were made in a number of towns during the months of May to November From a total of over 5 000 observations made by an average number of fifty stations he comes to the conclusion that alternaria spores are an inhalant comparable in importance to ragweed pollen The view that moulds are of importance is supported by Feinberg Prince Lamson and Underwood whereas Brown Credille van der Veer and Rackemann have a more conservative view of their importance

Bernton and Thom (1937) found that cladosporium acts as an allergen causing asthma or hay-fever in tomato growers This mould is responsible for the colour of decaying vegetables It is also mentioned by Guba (1936) as causing the asthma associated with tomato plants Another cladosporium—*Cladosporium fulvum* Cooke—has previously been mentioned as a cause of asthma by Cobe (1932)

I have examined 185 allergic patients in England of whom 148 suffered from asthma and twenty-one from hay fever and rhinitis The 148 asthma patients were made up of ninety two males and fifty six females Of these males eighty were tested with moulds and positive results were obtained in forty-one cases Of the females fifty-one were so tested and twenty-eight gave positive results Of the males seventy five were tested with bacteria forty six giving positive results Tests with bacteria were also carried out on forty five females twenty seven positive results being obtained

Table giving the Incidence of Positive Skin Reactions towards Moulds and Bacteria in England and Germany

	Males		Females		Totals	
	Moulds	Bacteria	Moulds	Bacteria	Moulds	Bacteria
England						
Tested	80	75	51	45	131	120
Positive	41 (51)	46 (61)	28 (55)	27 (60)	69 (53)	73 (61)
Germany						
Tested	290	290	232	232	522	522
Positive	43 (15)	54 (18)	41 (18)	54 (24)	84 (16)	108 (21)

The table shows that positive skin tests with moulds and bacteria were obtained with comparative frequency in England the figures with moulds being about the same as those reported by Schonwald from Seattle On the other hand the figures observed in Germany which are similar to the 15 per cent reported by Hansen for that country compare with the results reported from the interior of the United States It is most probable that this is due to the damp climate of England and Seattle corresponding to their similar geographical situation in the two continents The relative frequency of positive skin tests with bacteria cultured from asthmatic sputa is also probably due to the fact that infections of the respiratory tract are more common in wet climates than in others

Clinical Memoranda

Sulphonamides for Meningococcal Meningitis

References to the success of the sulphonamides in the treatment of meningococcal meningitis are still not very numerous A report of two cases so treated may be of interest

CASE I

A male child aged 7 months was admitted late on November 24 1937 unconscious, convulsed on the fourth day of illness, with a diagnosis of probable pneumococcal meningitis A head only of fluid was obtained on lumbar puncture The child was conscious next day

A Gram negative diplococcus giving the sugar reactions of the meningococcus was found Anti meningococcal serum was given intrathecally and intramuscularly on November 28, and subsequently 150 c cm in all were given by December 16 On that day the cerebrospinal fluid contained 115 cells per c mm the direct film showed pus and meningococci chlorides were 648 mg per 100 c cm and meningococci grew on culture The child's temperature was 104° F, pulse 172, respirations 54

One c cm of 5 per cent soluseptasine (M and B) in 4 c cm anti meningococcal serum was given intrathecally and half a tablet of soluseptasine by mouth During the next forty-eight hours the infant was extremely ill the temperature rising to 106 F On December 17 the cerebrospinal fluid contained 60 cells per c mm and the film showed Gram negative diplococci On December 20 there were 39 cells per c mm a film showed no organisms but culture revealed a Gram negative bacillus (found to be a contamination from a supply of supposedly sterile water) The temperature fell to under 100 F on the 19th and did not rise again

The child was discharged on February 5 1938 well but with paresis of right arm and leg which has since cleared up

CASE II

A child of 11 months was seen on May 7 1938 with head retraction and absent abdominal reflexes I took him into hospital at once by car (mainly because it was a Saturday and the laboratory closes at noon) A lumbar puncture was done and 1 c cm soluseptasine given mixed with aspirated cerebrospinal fluid and 4 c cm 5 per cent soluseptasine was also given intramuscularly The cerebrospinal fluid showed *2,400 cells per c mm and meningococci*

The child was transferred to the local isolation hospital on May 8 5 c cm soluseptasine was given that day and half a tablet of soluseptasine by mouth twice a day On May 9 the cerebrospinal fluid contained 300 cells per c mm chlorides were 660 mg per 100 c cm and culture was sterile Next day 5 c cm anti meningococcal serum was given intrathecally and 5 c cm intramuscularly Soluseptasine was given by mouth until May 14 The cerebrospinal fluid on May 19 contained 15 cells per c mm chlorides were 717 mg and culture was sterile

SUMMARY

One severe and one mild case of meningococcal meningitis are reported Both recovered The severe case was not apparently helped by serum, but rapidly improved under treatment by sulphonamide

In the mild case a sterile cerebrospinal fluid was obtained forty eight hours after sulphonamide was given and prior to any serum treatment

Curiously enough these are the only two cases of meningococcal meningitis I have seen in twelve years in general practice

I am indebted to Dr P Lazarus Barlow for the pathological reports

A H WINCHESTER MB St And FRCS Ed
Bexhill on Sea

A Case of Streptococcal Meningitis

A girl aged 7 was admitted into Loughborough Hospital with definite signs of severe meningitis She had a history of a discharging right ear for ten days following an attack of influenza There was no evidence of mastoid involvement The ear was dry on admission

Lumbar puncture performed on the first day produced a cerebrospinal fluid which was under great pressure and cloudy The report describes it as "a frankly purulent fluid with a predominant *polymorphonuclear leucocyte* reaction Cultural examination has yielded a growth of streptococcus A further report on the same specimen stated that these were haemolytic streptococci The next day before the report was received 10,000 units of *meningococcal antitoxin* were injected intramuscularly with the result that the temperature of 104·4° F dropped to 99° F eight hours later On receiving the report 3,000 units of streptococcal antitoxin (scarlatinal type) were given intramuscularly This was repeated the next day The temperature was then 101° F The following day 6,000 units were injected intramuscularly but the temperature began to swing between 104° and 99° F We then gave three daily intravenous injections of 9,000 units (30 c cm) The temperature fell to normal after the first injection and stayed down for the two days following The next day 9,000 units were introduced intramuscularly, with the result that the temperature rose to 102° F Four daily intravenous injections of the scarlatinal antitoxin were then given in decreasing doses of 9,000 6,000, 6,000 and 4,500 units respectively—a total of 25,500 units (85 c cm) Since the first of these four injections the temperature has remained normal

Lumbar punctures were done daily, and the cerebrospinal fluid only became clear (pathologically) after the first series of intravenous injections of antitoxin The temperature and pulse are now normal and the child is behaving normally There was a slight serum reaction on the eighth day of treatment, in the form of erythematous patches and occasional wheals The antitoxin injections were given daily but three minims of adrenaline were injected subcutaneously on the day the rash was first seen and this disappeared in two days The ear condition seems to have subsided completely as well On the first lumbar puncture done under open ether anæsthesia paracentesis of the right drum was performed, and apart from a slight discharge which stopped after four days, the ear has kept dry and there has not been any discomfort from it since The child has been discharged from hospital and has since been well

The rapid response to intravenous antitoxin therapy indicates that this form of treatment is worthy of consideration in cases of meningitis following middle ear infections The total dosage of scarlatinal antitoxin was 245 c cm or 73,500 units of which 175 c cm were given intravenously

The serum used was Parke Davis and Co's streptococcal antitoxin (scarlatinal type)

Reviews

POST-OPERATIVE RADIOGRAPHY OF THE BILIARY TRACT

L'Exploration Radiologique Post Opératoire de la Voie Biliaire Principale By B Desplas P Moulonguet and P Malgras (Pp 120 40 figures 40 fr) Paris Masson et Cie

This volume deals with the radiographic exploration of the biliary passages after operation and opens up a new field in surgery The method employed is the injection of either lipiodol or tenebryl into a drainage tube left after operation on the gall bladder or bile ducts So impressed have the authors been by the value of the results obtained that it is now part of their routine treatment carried out a few days after operation In some cases the operation itself has been of a complete nature with the removal of stones in the bile ducts when the object of the injection was to ensure that the passage was clear and that no stones had been left behind In other cases a preliminary drainage has been deliberately performed and the radiographs serve to indicate what further procedures are required

The monograph is amply illustrated with actual radiographs of injected cases the interpretation of which is greatly facilitated by key sketches They demonstrate the extraordinary ramifications of the bile ducts the extent of which is really astonishing They also show the free communication which commonly exists between the bile ducts and the duct of Wirsung while certain of them show with great beauty the mechanism of the sphincter of Oddi The subject is so entirely new that we are unable to form an estimate of its possibilities but we have no doubt at all that it is one which demands the close consideration of every surgeon operating on the biliary passages The monograph is equally remarkable for its originality and its admirable presentation

DIFFERENTIAL DIAGNOSIS

Differentialdiagnose in der Inneren Medizin By Professor Dr Med O Naegeli Part III (Pp 722 59 illustrations RM 10 80) Leipzig Georg Thieme 1937

The third part completing the whole of Professor Naegeli's book on differential diagnosis in clinical medicine has now appeared The earlier portions of the work were favourably commented on in this *Journal* eighteen months ago and the present section continues on the high standard already attained The book has 700 pages of text and 22 pages of well arranged index Professor Naegeli whose recent death we deplore, has everywhere impressed it with his own personality and experience and it is thus one of the best books available on the subject of differential diagnosis In dealing with the diagnosis of the febrile state the author points out how much has been gained by the application of serological and other laboratory methods in differentiating the fevers of hitherto undefined origin There is no sure diagnosis from the course of the temperature curve itself Of the simple continued fevers typhoid is still the most prevalent the various aspects and complications of typhoid are therefore used to contrast with those diseases which may simulate them though certain acute febrile diseases with exanthemata have characters of their own The tropical fevers are included so that a reference to the book should enable anyone to be aware of the salient points leading to a correct diagnosis Joint diseases are dealt with under the broad headings of those with fever and those which may be accompanied by fever A separate section on the differentiation of diseases of the vertebral column is specially useful The final sections on diseases of the kidney and urinary tract of the nervous system and of the organs with internal secretion are equally good

It is remarkable how much information the author has been able to pack in to a small space the essential features of the normal and abnormal electrocardiogram are given in about ten pages Throughout the book there is evidence of the critical faculty the teaching capacity and the research spirit which brought Naegeli to a respected position on the Continent not only for his work on the blood alone but also in general medicine

YEARBOOK OF UROLOGY

The 1937 Year Book of Urology Edited by John H Cunningham M D (Pp 472 120 figures 2 50 dollars 10s 6d postage 6d) Chicago The Year Book Publishers London H K Lewis and Co 1937

This handy well printed and well illustrated volume maintains the high standard of its predecessors in offering a succinct and critical compendium of current urological activities The good result of a bilateral plastic operation for hydronephrosis after ten years makes one wish that more late results of such operations were published The transatlantic love of scientific accuracy is reflected in such classifications as pus grade 3 erythrocytes grade 3 But when it comes to tenderness grade 3 (p 151) are we to look forward to headache grade 2 constipation grade 4 etc? The surprising statement that the administration of chondroitin sulfuric acid is the best known agent for prevention of stone formation may reflect the inefficacy of most so-called preventives It is noteworthy that most children with vascular obstruction of the ureter are treated for months for chronic pyelitis and that in the absence of infection the renal changes are regularly interpreted as interstitial nephritis although a correct diagnosis can usually be made by complete urological examination Criticism is rightly expressed of those gynaecologists who say If one does not know what to do then cut the presacral nerve Pyelitis hydronephrosis and male sterility are mentioned as observed sequelae The confession of *110* perurethral resections with sixteen deaths at a reputable clinic is a refreshing change from the monotonous and largely incredible reports of hundreds of resections without a death Another valuable commentary is the statement that cystostomy followed by resection is the safest prostatic procedure With regard to bilateral cryptorchidism the report that of fifteen patients in whom orchidopexy had been done in childhood nine were fertile is very encouraging *All urologists should* read this book

THE PAGET TRADITION

The Paget Tradition By G Grey Turner (Pp 148 2s 6d) London Cassell and Co Simpkin Marshall 1938

James Paget (says Professor Grey Turner) physiologist pathologist surgeon and man of honour was one of the greatest ornaments of the Victorian era As the leader of the profession in his day he stood for rectitude in surgery His example has become a tradition not only at St Bartholomew's Hospital where he was nurtured but in all those parts of the world where it was carried by his many pupils Of this tradition Professor Grey Turner has written three charming essays in language which does

credit to his knowledge of English The first essay is the address he gave in Boston when he was presented with the Henry J Bigelow medal It tells the story of Paget's life and shows how he came to exercise so great an influence upon his generation He was a teacher and consultant in the strictest sense of the word Through the two small rooms of his little house in Harewood Place, then a dead end with locked gates into Oxford Street, passed for many years all that was interesting or obscure in English surgery

The second essay is devoted to Stephen Paget, the youngest son of Sir James It is entitled, What Research Owes to the Paget Tradition,' and is the eleventh Stephen Paget Memorial Lecture Much of his useful and all too short life was spent in the service of the Research Defence Society It was well said that 'when it is one man's business to propagate a delusion and nobody's business to destroy it, Truth is apt to find herself more than usually hampered" Stephen Paget set himself to free her from the shackles The third essay is entitled "Opportunity,' and was the winter address given at the Welsh National School of Medicine in 1934

The publishers state that the little book has been published at the request of Professor Grey Turner's past and present students 'No profit whatever is being made by the author, or in fact by anyone but the booksellers" Even they cannot be much in pocket, because it only costs half a crown, the money is well expended since it contains much of interest for every reader

DISEASES OF THE BLOOD

The Diagnosis and Treatment of Diseases of the Blood By Thomas Ordway M D and L Whittington Gorham M D Revised by Raphael Isaacs M D (Pp 605 33 figures, 15 coloured plates 32s 6d net) London New York Toronto Humphrey Milford, Oxford University Press 1938

The textbook on *Diseases of the Blood* by Ordway and Gorham is described as revised by Dr Raphael Isaacs and the foreword bears the date December 1937 The reader is a little surprised to find that the pages are not numbered consecutively, some having been interpolated, and that there is a supplementary index His surprise deepens into concern when he finds that the section on agranulocytosis contains no reference later than 1927 and makes no mention of amidopyrine under aetiology or of nucleotide, liver, or bone-marrow under treatment An article on the hypochromic anaemias has been inserted, but the original chapter on chlorosis has not been altered to suit and still mentions cases of atypical or chronic chlorosis Mitchell and Schmidt are quoted as finding that ferric chloride and ferric ammonium citrate, which are soluble, were much more effective in building haemoglobin than ferric oxide and ferrous carbonate, which are insoluble without indicating that their experiments were performed on rats and that in man the ferrous salts are more effective than the ferric The count of anaemia in pregnancy is antediluvian and pernicious anaemia of pregnancy is recognised definitely as an haemolytic anaemia, probably produced by a toxin from the placenta' Treatment by hydrochloric acid and blood transfusions is advised and the number of cases treated by liver is said to be still too few to draw conclusions No mention is made of nutritional deficiency under aetiology or of marmite under treatment In the treatment of leukaemia more stress is laid on radium than on x rays and on benzol and malariotherapy than on arsenic In the chapter on haemophilia the value of snake venom is not indicated Neither the original index nor the supplementary index refers to scurvy

Enough has been said to show the many deficiencies of this book 'In few fields of medicine,' says the foreword, 'have more important advances been made in recent years than in the diagnosis and treatment of diseases of the blood' We can only warn our readers that no adequate account of these advances is contained in the volume under review

BRITISH HEALTH RESORTS

Official Handbook of the British Health Resorts Issued tion (2s 6d net) London J and A Churchill Ltd

The new edition of the handbook of the British Health Resorts Association contains a vast amount of knowledge succinctly set out, concerning the spas and the seaside and inland health resorts of Great Britain This year a section has been incorporated giving particulars also of spas and climatic resorts in the Dominions and certain of the Colonies

The coasts of the British Isles include five distinct climatic regions—north-western, south-western, southern, south-eastern, and eastern Nearly all the places belonging to the first four groups may be described as winter as well as summer stations Many seaside places in the south and west have a warm and equable winter climate, being largely unaffected by the cold polar currents, and protected from easterly winds by hills or wide spaces of intervening land In addition to what may be called these regional climates there are innumerable local climates depending on the aspect, shelter, geological formation, even the vegetation of a given place, and this may be of importance from the medical point of view It looks as if, instead of the general advice to go to the sea, or the moors, or the mountains, or to a spa, the practitioner will have to prescribe health resorts with something of the particularity with which he prescribes drugs In that event the handbook bids fair to form an excellent equivalent to the *Pharmacopoeia* Under the editorship of Dr Fortescue Fox, it is an authoritative and impartial publication, packed with detail, and the happy illustrations on every page almost make one want to be an invalid The fullest information is afforded of the twelve spas of the British Isles (meaning by spas places at which establishments for medical use have been set up at the source of recognized natural medicinal springs) Particulars are given of the situation and history of each spa, its geology, climate the constitution of its waters, and the bathing and other facilities When so much is given it is rather churlish to ask for more, but a few more particulars of spa hospitals would be useful

This spreading volume, which began many years ago as an inset in the *Medical Directory* is now owned entirely by the British Health Resorts Association which intends to secure for it a greatly increased circulation, largely among members of the medical profession It is well on its way to becoming one of those few publications which are indispensable

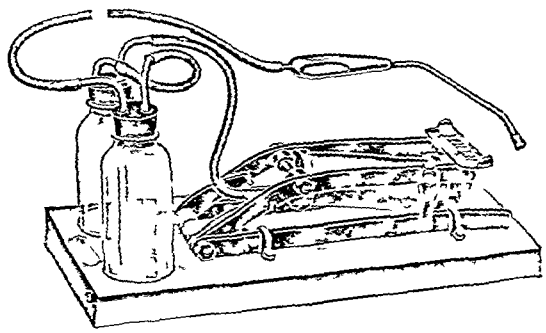
Notes on Books

Studies on the Physiology of the Eye by J GRANDSON BYRNE M D LL D, is reissued with supplement and new index by H K Lewis and Co at 40s It is a collection of papers each more or less self contained and dealing with a large variety of subjects but mainly with the innervation of the pupil and the lid and with the proprioceptive system of the external ocular muscles The work recorded deals essentially with experimental observations on the cat and much space is devoted to the paradoxical reactions Much in this collection of

papers departs from accepted teaching It is possible to indicate only broadly the author s conclusions He holds that the primitive response is of a chemical type the stimulus acting directly on the muscle It is this type of reaction which is responsible for paradoxical reactions A later development is the chemico neural response the chemical stimulus acting indirectly through the neural centre The highest state is the reflex response

A valuable book of reference for all who have occasion to inform themselves about the London hospitals is *The Hospital Guide* which has reached its fourth edition (price 3d) It is published by the Advisory Hospital Committee of the Hospital Saving Association (30 Lancaster Gate Hyde Park W 2) and naturally has been compiled from the point of view of the contributory movement One table shows the progress of the Hospital Saving Association itself which in 1937 reached for the first time over one million pounds in contributions and had over one and three quarter million contributors Contributions and contributors have almost doubled since 1931 But the body of the *Guide* is full of information regarding all the voluntary hospitals of the metropolitan area giving details of accommodation charges or terms hours of attendance in the different departments and even bus routes and the like

Fermente Hormone Vitamine und die Beziehungen dieser Wirkstoffe zueinander by ROBERT and WILHELM DIRSCHERL is published at Leipzig by Georg Thieme at the price of RM 30 For ferments hormones and vitamins the authors propose the generic name of ergines According to their definition ergines (efficient substances) are such organic compounds as are formed in the living cell and necessary for the normal course of life in plants and animals They act in such small amounts that their effect cannot be due to the energy produced by the combustion of the molecule *The book under review* deals with the three groups separately and comprehensively and adds a chapter on the relations between ferments and ferments ferments and hormones ferments and vitamins hormones and vitamins hormones and hormones and vitamins and vitamins The literature seems to be taken into consideration well into the year 1937 but a bibliography would have been a very useful addition



Not So Long Ago A Chronicle of Medicine and Doctors in Colonial Philadelphia by CECIL K DRINKER M D Sc D is published in this country by the Oxford University Press at 15s Professor Drinker s great great grandmother who was a member of a Quaker family which moved to the site of Philadelphia a few years before William Penn founded that city of brotherly love in 1682 kept a diary there for nearly half a century until her death in 1807 Parts of this footnote to history have been already published and Professor Drinker made use of *other parts—and they were many—about disease* as a basis for a series of lectures at the Lowell Institute These lectures have been utilized in this publication The text of the diary has been scrupulously copied with all its abbreviations inconsistencies and mistakes It tells the story of the large families which took up all the time of married women if they lived at a time when so many men had a succession of two or three wives There is much about the diseases—tuberculosis small pox yellow fever fever and the bloody flux (dysentery probably bacterial)—then rampant in Philadelphia and the medical men especially Benjamin Rush who wrote a small pamphlet about Old Drinker who lived to be 103 Professor Drinker has added an extremely interesting running commentary on the records of a time when medical men were kept busy and responded with a great armament of system and theory but with a minimum of fundamental knowledge The contrast between medicine then and now is graphically displayed

Preparations and Appliances

SIMPLE PORTABLE SUCTION PUMP

Mr J EWART PEPYES (Bromley Common Kent) writes

Every surgeon has felt the need for a simple portable suction apparatus which could be counted on to give a sharp suction stroke when required A motor tyre foot pump

seemed to present a good basis for experiment Messrs Down Bros by carefully balancing the reversed non return valve have produced a cheap and efficient suction apparatus which can be relied on to clear a throat of mucus or blood clot and to remove fluid from an abdomen or a cyst which has to be tapped If manipulated carefully it can also replace a Potain s aspirator The bottles are of reasonable size and the stand has been kept very simple to make the ensemble cheap and light

PROTAMINE ZINC INSULIN

Protamine insulin (with zinc) suspension has been produced conjointly by Allen and Hanburys Ltd and the British Drug Houses Ltd It is a sterile suspension of protamine insulin (with zinc) with a reaction of *p*H 7 1 The preparation is slightly turbid and the phials must be shaken before use

The introduction of the slow acting protamine zinc insulin was an advance of very great importance in the treatment of diabetes but hitherto its use has been hampered by the fact that it was necessary to mix separate solutions shortly before use The manufacturers have surmounted this technical difficulty and have produced a preparation which will keep for six months after manufacture and for a fortnight after the rubber of the cap of the phial has been pierced This represents a technical improvement of considerable practical importance

The manufacturers issue a very useful pamphlet explaining the special properties of protamine zinc insulin and the manner in which it should be used The value of protamine zinc insulin depends on its slow and persistent action but this involves certain special dangers The fall in blood sugar is so slow that warning symptoms of hypoglycaemia may not arise and a severe attack may follow suddenly moreover the action is so long that it will outlast a single replacement of carbohydrate

GONADOTROPIC HORMONE

Gonadyl (Roussel Laboratories Ltd) is a preparation of the gonadotropic hormone prepared from pregnant mare s serum The preparation is in powder form in ampoule and is dissolved immediately before use Each ampoule contains 40 rat units (=160 mouse units) The gonadotropic hormone has been used with pronounced success in the treatment of cryptorchidism It has been tried in a variety of disorders of menstruation and is also being tried for azoospermia and impotence

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY JULY 9 1938

ROCKEFELLER AND THE FRONTIERS

The story is told of a revolution which broke out in a Central American city some twenty years ago A medical investigator was engaged there at the time in studying yellow fever control and determined to continue his researches in spite of the hostilities Every morning with a flag of truce he crawled through the barricades to collect his mosquitos on one side of the fighting line, and in the evening crawled back again to gather up his specimens on the other Neither army molested him, but both thought him crazy—a man who, when great issues of human destiny were being fought out, spent his time catching insects To day in that part of Central America the revolution is forgotten, but the name of the investigator, Emmett Vaughn, is remembered as that of the man who helped to stamp out an age-long pestilence Which is of course, a parable But a sorrowful footnote has to be written, that such is the present intensification of nationalism and racialism in various parts of the world that even the collecting of mosquitos is now sometimes impossible Mr Raymond B Fosdick, the lawyer-president of the Rockefeller Foundation, in his *Review for 1937*, writes of the new international barriers which interrupt and embarrass the pursuit of philanthropic purposes and the advancement of knowledge Objective scholarship, he says, is possible only where thought is free and freedom can exist only where there is tolerance where there are no "keep out" signs against the inquisitive and questioning mind Disinterested research cannot survive in an atmosphere of compulsion and repression In some fields the Foundation is finding it profitless to go where formerly it went It is stopped at some frontiers, not because the frontiers have any greater geographical significance than they had a few years ago but because behind them the search for truth by eager and sceptical minds has been made impossible

Nevertheless the benefactions of the Foundation continue on the grand scale In 1937—the year of J D Rockefeller's death—the Foundation appropriated for philanthropic purposes a sum of nearly two million pounds Of this amount nearly one quarter was given to the medical sciences, another fifth to public health, and the remainder for work in other social and natural sciences and the humanities The largest single appropriations were £80,000 for the maintenance of Peiping Union Medical College, China £70 000 to Harvard University for research on industrial hazards and £60,000 to Yale for the Department of Psychiatry The benefactions to public health took the form of aiding various health departments, education in public health and the study and control of specific diseases These diseases included yellow fever in South America and Africa hookworm and schistosomiasis in Egypt, tuberculosis in Jamaica and Austria, scarlet fever in Rumania, influenza in Hungary and malaria in a number of countries Diseases know no frontiers and are no respecters of flags "In this field of public health' comments Mr Fosdick "more clearly perhaps than in any other phase of human effort one sees the complete inadequacy and meaninglessness of the conception of the absolute sovereignty of the State' The field studies undertaken during the year have added a good deal of information regarding the conditions under which jungle yellow fever occurs The absence of *Aedes aegypti* from infected areas has been amply confirmed and further evidence has been accumulated suggesting that human cases are not essential—even that they are relatively unimportant—in the maintenance of jungle infection The biological control of the insect vector so successful in the case of urban yellow fever, is not applicable in this field, and the elimination of animal hosts is not economically possible throughout the vast regions of South America, where jungle infection abounds The only hope of prevention at present lies in individual immunization of exposed populations by vaccination, and during 1937 well over 40,000 persons were vaccinated in Brazil and Colombia

At present, in its appropriations for medical sciences, the Foundation is concentrating on assistance to psychiatry The comment is made that mental disease is only now slowly being divested of the opprobrium meted out to misconduct Mr Fosdick speculates as to the attitude to the common cold if one of the early signs, along with sneezing and chills, was a transitory attack of kleptomania 'The ancients saw mental abnormality as a possession by demons, the quasi-modern layman still sees it as a disgrace, the modern man is coming to recognize it as a disease" It cannot yet be said that the development of psychiatry has paralleled the development of other branches of medicine As a new science it has not yet gathered about itself a body of knowledge or trained personnel comparable to that achieved in other disciplines and to its frequent isolation from the rest of

medicine must be ascribed the fact that it has sometimes run to strange cults and theories The Foundation is trying to infuse medicine with psychiatry and neurology Since 1932 it has given roughly £1 200 000 for this purpose The appropriations for 1937 included £8 000 for the support of the Department of Experimental Medicine at Cambridge with a view to aiding in the development of psychosomatic studies in this country

A discerning tribute is paid to J D Rockefeller who was no mere distributor of largesse but a man of far reaching vision He did not hold the view as so many benefactors have done that wisdom came to an end with his own generation He was not under the illusion that what seems important to-day will necessarily be important to morrow Therefore he did not tie up his Foundation to rigid and unchangeable purposes Nor did he believe in the maintenance of the Foundation in perpetuity—"perpetuity' he was apt to say "is a pretty long time'—and therefore the Foundation can and does spend its capital as well as its income It has adopted some liberalizing provisions whereby, ten years after the date of a gift the income from it may be used in whole or part for some purpose other than that for which the gift was made, and after twenty five years the principal in part or whole may be so used subject in both cases to the qualification that the new purpose shall be as reasonably related to the original as may be found practicable at the time having regard to intervening changing conditions This explains the occasional redirections of Rockefeller policy which have puzzled some people Rockefeller and those who come after him have been anxious to free their work from the embarrassment of "frozen' funds and tired endowments of which those who have to do with ancient—and some modern—foundations in this country know too much

THE MANAGEMENT OF PHTHISIS

Much of recent discussion on the after-care of the tuberculous patient has been based on little more than vague surmise A report[1] compiled by E Brieger and edited by Sir Pendrill Varrier-Jones Dr Bachmann of Switzerland and Dr Bronkhorst of Holland for the International Union against Tuberculosis gives for the first time a comprehensive account of carefully sifted evidence from which more reliable conclusions may be drawn In this country it is generally agreed that both the immediate and the remote results of sanatorium treatment are bad The proportion of patients whose sputum contained tubercle bacilli discharged with negative sputum tests is disappointingly low That it could be improved is brought out clearly in the report This has been achieved by what Brieger calls combined intensive treatment He defines this as including prolonged rest hygienic measures chrysotherapy collapse therapy and surgical procedures used in various combinations and sequences with one object in view—healing the tuberculous lesion, which implies that no tubercle bacilli can be detected by culture of the sputum or gastric contents and/or animal inoculation of the gastric contents At the Bilthoven Sanatorium in Holland for instance the proportion of patients admitted with positive sputum tests and discharged with them negative has been raised from about 25 per cent in 1921 to over 70 per cent in 1936

More time is needed before a true estimate can be made of the final results of combined intensive treatment but it is claimed that the proportion of relapses in the patients discharged as sputum negative or conditionally arrested is not increased In such of these patients as remain under observation any relapse is detected early and can also be dealt with by combined intensive treatment The proportion of untreatable good chronic cases is, however increased Lawrason Brown and H L Sampson have defined this group thus 'A cavity 2 cm in diameter or larger must be present The general condition must be favourable The temperature and pulse must be normal during the period of observation of several months The appetite and strength must be good and the patient must sleep well Expectoration may be present but must not be excessive He is usually able to take some exercise The number of tubercle bacilli in the sputum is not taken into consideration The net result of applying combined intensive treatment is therefore to save lives to increase the number of patients with healed lesions and to enlarge the group of good chronic cases at the expense of the 'bad chronic cases which are those not conforming to Brown and Sampson's criteria The problem of after-care arises not with those patients who are well enough to return to their work provided they can be trusted to live reasonably nor with those in whom the disease is so advanced that isolation in hospital is necessary but with a large intermediate group After-care is needed for the 'conditionally arrested' patients who must be rehabilitated before returning to their original jobs or to new occupations and for the good chronic cases For the latter permanent settlement in an appropriately developed village on the lines of Papworth is indicated for the former, a training centre

[1] *After Care and Rehabilitation* By E Brieger Published by the *British Journal of Tuberculosis* as a special supplement, October 1937

The training centre and the village settlement are not alternative solutions to the same problem Each meets a different need and has a different object in view, though there is no reason why the two should not form part of the same unit It has been found necessary at Papworth to add to the village a large sanatorium-hospital section well-equipped laboratories, and a surgical unit, and it has been thought that the period spent in a village settlement might be limited for the completely arrested case, so that in these instances the village settlement would function as a training centre These things lead us to suggest that perhaps the whole problem of after-care might be approached in an opposite direction, beginning with the sanatorium and hospital, adding to them the training centre, and allowing the village settlement proper to evolve around these institutions What is needed is a departmental unit completely equipped for the treatment and after-care of the tuberculous poor, for treatment and after-care are indivisible parts of the same entity A patient cannot be expected to submit to prolonged treatment unless his livelihood and that of his family are assured in the event of his becoming as a result of combined intensive treatment, a "good chronic case" It is fortunate that more than half of this group are unmarried The falling mortality from tuberculosis gives no ground for complacency Tuberculosis remains an important economic and social problem, the solution to which may partly lie in the evolution of units in which one authority has the sole responsibility for both the treatment and after-care of cases of tuberculous infection of the lung

CHANGES IN TEETH FOLLOWING PARATHYROIDECTOMY

The incisor teeth of the albino rat are sensitive indicators of fluctuations in the metabolism of calcium and phosphorus and are therefore useful in studying the physiology of the parathyroid glands Schour Chandler and Tweedy [1] in a recent re examination of the influence of parathyroidectomy on the structure of these teeth have confirmed some of the earlier findings of other workers but not all Some of the previous work was carried out on rats fed on diets now recognized as deficient in vitamin D calcium and phosphorus which probably accounts for the differences now observed by Schour and his co workers who used a diet adequate in calcium phosphorus proteins carbohydrate fat and almost certainly in vitamin D though the content is not stated Calcium formed 1 41 per cent of the diet and phosphorus 0 95 per cent The changes in the structure of the teeth were examined in respect to gross and microscopical changes in (Group I) eighteen rats which were allowed to survive 3 to 20 days in (Group II) fifty-seven rats which survived 39 to 159 days in (Group III) fourteen rats which survived 105 days and were subjected to fasting every seventh day in (Group IV) eleven rats which survived four months to one year and which underwent repeated pregnancies and lactations and in (Group V) twenty-seven controls In Group I (short survivals) the dentine formed after operation was more densely calcified than normal It is demarcated from the dentine formed before operation by a distinct ring (the calcio-traumatic ring) which appears to be an acute response to a shock to calcium metabolism The denser calcification of the post-operative dentine may be a result of the calcium retention that is reported to persist during the early survival period In Group II (longer survivals) calcification is defective the longer the survival the more defective is the calcification The dentine shows an irregular and accentuated alternation of zones of different densities in calcification which is probably responsible for the readiness to fracture of the dentine of parathyroprivic rats In Group III (long survivals with fasting every seventh day) the histological changes were found to be aggravated In Group IV (long survivals with repeated pregnancies and lactations) there was no evidence of withdrawal from the calcified tissues of the teeth Schour Tweedy Chandler, and Engel [2] have also compared the effects of parathyroid extract and of calciferol on the incisor of the parathyroidectomized albino rat The effect of the parathyroid extract given to twenty-nine rats is the same as that observed in normal dentine—namely, a short primary hypocalcified region (staining with eosin) and a secondary hypercalcified region (staining with haematoxylin)—but doses which were ineffective in normal animals were enough to produce the typical response in the experimental animals In some animals which survived longer than six days, however the deeper staining reaction receded and blended with the staining reaction of a normally calcified dentine Generally, a calcio traumatic ring was found, and cytological changes in the active enamel-forming cells were found in one half of the animals Similar changes were found in thirty parathyroidectomized rats which were given single doses of 46,000 to 644,000 international units of calciferol In this group of rats the serum calcium rose during the first three days after administration of calciferol then declined slowly to the original level The maximum height and the rapidity of the rise increased with the dosage The earlier findings of these workers—that the presence of the parathyroids is not needed for massive doses of calciferol to exert their effect—is therefore confirmed

POST-VACCINIAL ENCEPHALITIS

The incidence and fatality of post-vaccinal encephalitis formed one of the subjects recently discussed at the International Office of Public Health [1] when Professor Reiter the German delegate stated that during 1936 ten suspected cases after primary vaccination had been reported In five the diagnosis was supported by

[2] *Amer J Path* 1937 13 971
[1] *Bull Off int Hyg Publ* 1938 30, 737

clinical examination but in none by necropsy Three patients recovered and two died The one necropsy which was performed showed meningitis but not encephalitis According to Dr M T Morgan the British representative five cases of post-vaccinal encephalitis of which three were fatal were reported in England and Wales in 1936 and three more in 1937 up to September 15 which were all fatal The ages of the children ranged from 4 months to 15 years As in the German cases the encephalitis was always the sequel of primary vaccination No mention is made of a post mortem examination Professor G Petragnani the Italian delegate stated that of 1 104 520 primary vaccinations and 1 205 971 revaccinations performed in Italy in 1936 and in the spring of 1937 only five cases were reported in 1936 and six in 1937 In every case the intradermal method was used Of the eleven cases four were in the north of the kingdom two in the centre and four in the south Ten occurred in the spring and only one in the winter Six were fatal and in two pareses appeared as sequels The ages of the patients ranged from 8 months to 8 years and no case occurred in children vaccinated at the sixth month in accordance with the law concerning primary vaccination According to Professor Kling the Swedish delegate in the period 1924–36 inclusive there had been forty three cases of encephalitis following primary vaccination with eight deaths and eleven cases with two deaths following revaccination As regards age distribution most of the cases appeared during the first two years of life and immediately before school age

TREATMENT OF MYOTONIA

Recent work on the chemistry of the changes which occur at the neuromuscular junctions on discharge of the nervous impulse has led to important advances in the therapeutic field especially in primary disease of the muscles The action of physostigmine in delaying the destruction of acetylcholine by the cholinesterase has been found of specific benefit for example in myasthenia gravis In that group of diseases in which the cardinal feature is myotonia—inability to relax the muscles after they have been contracted—a drug having the precisely opposite effect of physostigmine has recently been used with much success Those who attended the Section of Neurology at the Oxford Meeting of the B M A in 1936 may remember the cinematograph film presented by Foster Kennedy of New York which demonstrated strikingly the difference in the muscular actions of a man with myotonia congenita (Thomsen's disease) before and after injection of quinine dihydrochloride In the report[1] on this film Foster Kennedy showed clearly that the action of quinine in abolishing the myotonic reaction of muscle could be antagonized by subsequent injection of physostigmine which rapidly reproduced the original myotonia A further study of the action of quinine in myotonia has been published by Kolb Harvey and Whitehill[2] who have studied the effects of oral administration of this drug in eight cases of myotonia atrophica and in one case of myotonia congenita Although perhaps the least incapacitating symptom of that heredofamilial disease better known in this country as dystrophia myotonica myotonia is the one of which the patient is most conscious and relief from it may help to compensate him for the weakness occasioned by the gross atrophy of the muscles and the premature senility which is so characteristic of the disease Kolb and his co workers found that by giving 0 6 gramme of quinine sulphate by mouth three or four times daily patients with myotonia atrophica could be kept free from the symptom of myotonia There was no resulting increase in strength of the muscles as recorded by the dynamometer although several patients declared that the muscles worked better After treatment with quinine had proved effective these patients were given injections of prostigmin whereupon the myotonic reaction immediately reappeared even if quinine were given at the same time as the prostigmin which thus directly antagonized the effect of the quinine Conversely quinine counteracted the effect of prostigmin in myasthenia gravis increasing the signs of that disease Other therapeutic agents were investigated in the cases of myotonia atrophica but none was successful No symptoms of overdosage of quinine appeared with the large doses necessary to abolish the symptom of myotonia It was found that smaller doses than 0 6 gramme three times a day were ineffective and that if the drug was discontinued patients complained that the rigidity of muscles was worse than it had been before treatment was initiated It would seem therefore that once begun this treatment must be continued almost indefinitely Whether prolonged dosage with quinine will eventually have deleterious results has yet to be seen No series of cases has been under observation long enough for any conclusions to be reached In the meantime there can be no doubt that a valuable therapeutic agent has been found for the relief of a distressing symptom

THE ROYAL MEDICAL BENEVOLENT FUND

Annual reports are usually dry enough documents and the one hundred and second to come from the Royal Medical Benevolent Fund is no exception for 200 of its 220 pages consist of lists of subscriptions and donations But even these have their interest because not only are the subscriptions shown for 1937 but also the total amount which the subscriber had given before that year and it is encouraging to notice how many faithful friends this charity has enlisted In several cases the accumulated total against a subscriber's name is over £100 It is also shown what considerable and widely distributed support the Fund receives from the Branches and Divisions of the British Medical Association City companies masonic lodges and chapters medical societies hospital staffs and Panel Committees Over seventy Panel Committees subscribed during 1937 one of them (Norfolk) making a gift of £117 and fifty Divisions and Branches of the B M A contributed directly But the purpose of an annual report is to remind subscribers that their subscriptions for the

current year are due, and as there is always a tendency for such documents to go the way of circulars and other ephemeral literature the Fund this year is issuing with the report, but in a separate envelope a letter from Sir D'Arcy Power chairman of the committee of management, and also a selection of typical stories of persons benefited Sir D'Arcy Power describes briefly the activities of the Fund and the number of the grants and annuities He mentions that the income from subscriptions has been doubled during the last ten years, yet still it only represents something under seven shillings for each medical practitioner in Great Britain The great need is to enlist a larger number of annual subscribers, this would make it possible to raise the meagre amount given as an annual allowance in often very pitiful cases Volunteers are also requested for honorary local secretaryships

THE HEART IN RELATION TO ITS BLOOD SUPPLY

The efficiency of the myocardium depends largely on the quantity and quality of the blood in the coronary circulation, and two recent studies on this merit attention because of their practical importance Kountz and Smith[1] of St Louis have tried to assess experimentally the flow of blood in the coronary arteries of pathological hearts The information was derived from perfusion and heart-lung preparations of revived beating human hearts Under the conditions of their experiments the average coronary flow for normal hearts is estimated to be about 1 4 c cm per gramme of heart per minute In the hearts of persons dying of cardiac disease the total flow through the coronary artery was often greater, especially in greatly hypertrophied hearts, but when reduced to the terms of unit weight it was found to fall below the level of 0 75 c cm per gramme per minute, which Kountz and Smith regard as a minimal safe flow for the function of the heart In subjects with a history of heart failure the flow ranged from 0 15 to 0 6 c cm per gramme per minute The lowest figures were encountered in arteriosclerotic hearts Kountz and Smith consider that their work shows that hearts fail in chronic cardiac disease because of a limited flow through the coronary artery, which may result from either increased muscle mass or narrowing of the coronary vessels In dilated hearts lengthening and stretching of the coronary vessels may be the chief factor Tung and his associates[2] in a careful investigation into the effect of severe anaemia on the heart point out that in this condition the functional efficiency of the heart is of the highest importance since increase in the cardiac output is an essential compensation for the diminished carriage of oxygen in the blood The ten patients studied had severe chronic anaemia (haemoglobin values 1 5 to 3 5 grammes per 100 c cm or averaging about 17 per cent) and no other discoverable cause of heart disease yet in only one of them was the heart normal In six it was considerably enlarged and there was definite congestive failure, the venous pressure being elevated Three patients had much enlarged hearts but little or no evidence of congestive failure The degree of cardiac enlargement was assessed radiographically, and the difference between the measured area and the estimated normal area expressed as a percentage The increases in cardiac area varied between 25 and 143 per cent The x-ray illustrations reproduced in the paper reveal the gross cardiac dilatation which occurred in these anaemic subjects In the light of the findings of Kountz and Smith in regard to the decrease in coronary blood flow caused by dilatation the viciousness of the circle is apparent The poor state of the heart in severe anaemia explains the not infrequent fatalities attending rapid transfusion of blood in such cases The dilated and failing heart cannot take on the burden imposed by a sudden augmentation in the total blood volume Such fatalities not long ago formed the subject of articles by Plummer[3] and Pygott[4] and of correspondence in this *Journal* The work of Tung and his colleagues throws light on these deaths Transfusion in such cases may sometimes be essential, but it must be by a very slow drip method

RURAL HYGIENE

Representatives of European countries are to meet in a conference summoned by the League of Nations for July 1939, to consider the subject of rural planning and hygiene The Council of the League amid the graver preoccupations of its recent session at Geneva, approved the report of the preparatory committee for the conference which has been sitting under the chairmanship of M Wauters, Belgian Minister of Public Health A similar conference was held in 1931 and drew up a programme of studies to be carried out under the auspices of the Health Organization The conference recommended that another European conference should be summoned after an interval of a few years to examine the results achieved and adapt the proposals made to current problems and to the progress of public health technique Such is the real origin of the conference to be held next year One section of the preparatory committee's work deals with medico-social policy The previous conference it is stated, has exercised a considerable influence on the organization of public medical and assistance services in the rural parts of Europe in countries but it remains to extend the study to diseases which are still all too frequent in rural areas such as typhoid and tuberculosis together with diseases which affect both human beings and livestock *The conference* will have at its disposal further studies carried out on the international plane by the Health Organization relating to sanitation, the cost and efficiency of medical and sanitary assistance prevention of disease and the "medico social protection" of the rural population by which last is meant nutrition housing and rural planning The Health Organization has lately been undertaking in conjunction with public health authorities national nutrition committees and European institutions and schools of hygiene some further

[4] Ibid, 1937, 1, 496

studies on nutrition in order to ascertain the effective consumption of particular groups of populations to consider whether their dietaries are sufficient and to evolve measures for combating defects These studies have taken place in Belgium France Finland and half a dozen other European countries The composition of bread, and accordingly its nutritional value has been found to vary much from one country to another and even within particular countries A study of bread dealing with the species and sifting of cereals the form of consumption and so forth will be available before the conference meets As to milk the Health Organization already has copious material at its disposal on the place which milk should hold in a system of nutrition together with the hygienic questions arising in connexion with its production and distribution and this material is being extended and completed It is hoped that the participating Governments will later be in a position on the basis of these extensive international studies to give more detailed particulars in their several national monographs as to the nutrition of the rural classes in their respective countries On this subject of nutrition the Council has decided to invite the eighteen States within the League which have set up national nutrition committees to send representatives to Geneva for an exchange of views on subjects of common interest during the coming autumn League countries which have national nutrition committees include the United Kingdom with Australia and Canada among the Dominions France Belgium Holland Soviet Russia Poland Czechoslovakia Latvia and all the Scandinavian countries also outside Europe Egypt and Iraq The first meeting held in February 1937 derived great benefit from the participation of a representative of the committee recently set up in the United States and it was decided to invite an American representative again to participate in the forthcoming discussions

TRAUMATIC SHOCK

Recent experimental work on the nature of traumatic shock has demonstrated the relative unimportance of toxaemia at least in the early stages of the condition Toxaemia from infection particularly by gas producing organisms which so complicated the picture of cases of shock in the last war does not arise until a later stage It is unlikely that the absorption of crush products is a potent factor though as Sir Henry Dale[1] has suggested these may have some effect on capillary walls and so contribute to the loss of fluid which is apparently an important if not the most important aetiological factor The older surgeons looked upon the part played by nervous impulses as all important—for example Furneaux Jordan in the second edition of his *Surgical Enquiries* (1880) regarded the condition as

> the result of a powerful impression applied to the nervous centres or to a portion more or less considerable of the peripheral nervous expansion

Concentration on the factor of fluid loss has of late led to neglect of the nervous side of the question Shock can be prevented by complete occlusion of the arterial blood supply to a limb before it is injured and as Slome and O Shaughnessy have recently pointed out not only is loss of fluid prevented under these conditions but the limb may be rendered anæsthetic and the nervous factor eliminated An examination of the action currents in the nerves passing from a traumatized limb showed that no abnormal impulses could be recognized for three-quarters of an hour after the injury but that subsequently an almost continuous barrage of impulses developed There is some evidence to suggest that an initial fall of blood pressure in a case of traumatic shock is caused by loss of fluid and that a later and continued drop is due to the continued discharge of nervous impulses Control by appropriate analgesia or anaesthesia is therefore necessary as well as the restoration of the blood volume in the treatment of shock

REFUGEE DOCTORS FROM AUSTRIA

Sir Samuel Hoare the Home Secretary who was accompanied by Lord Winterton the Chancellor of the Duchy met at the Home Office on July 4 representatives of the British Medical Association the Royal Colleges of Physicians and Surgeons the University of London and the Society of Apothecaries to discuss the question of the admission of some Austrian doctors to practise in Great Britain It was agreed that it would only be possible to admit a limited number that any such admissions must be the subject of careful selection and that a committee representing the medical profession should be set up to assist in the selection The Royal College of Physicians of London was represented by Dr Robert Hutchison and Professor J A Ryle the Royal College of Surgeons of England by Sir Cuthbert Wallace the University of London by Sir William Girling Ball and Dr A M H Gray the Society of Apothecaries of London by Mr Hugh Lett and Sir William Willcox and the British Medical Association by Mr N Bishop Harman Dr H Guy Dain Dr J W Bone Dr G C Anderson and Dr A Macrae

Professor Sigmund Freud now living in exile in London was elected a Foreign Member of the Royal Society in 1936 As his health does not permit him to visit Burlington House to sign the ancient Charter Book of the Society the President and other officers have paid him the high honour of taking the book to him for his signature

Professor Frank C Mann who is Director of the Mayo Foundation for Medical Education and Research of the University of Minnesota will deliver in the Theatre of the Royal College of Surgeons of England on Friday July 15 at 5 p m a special lecture on the Mechanism of Peptic Ulceration which is to be a review of the results of experimental investigations Professor Mann is well known for his research into the problems of peptic ulceration and the College is pleased to invite Fellows and Members to attend Those who are neither the one nor the other will be admitted on presenting their private visiting cards

SURGICAL PROCEDURES IN GENERAL PRACTICE

This is one of a series of articles contributed by invitation

INJURIES IN THE REGION OF THE SHOULDER-JOINT

II BONE AND JOINT INJURIES

BY

R WATSON-JONES, M.Ch.Orth., F R.C.S.

One of the most important principles of the treatment of all fractures applies with particular force to fractures and dislocations of the shoulder joints which do not need to be immobilized must be actively mobilized from the first day If immobilization is not essential, mobilization is imperative A fracture of the clavicle should not cause more than a few weeks' incapacity But many healthy men have been incapacitated for a year or even incapacitated permanently by simple fractures of the clavicle treated with Sayre's strapping, which bound the fingers and hand flat against the chest wall In other cases abduction frames have been used with a palmar splint so situated that the patient could not flex the fingers normally With the tendency to oedema which exists immobility of the fingers for only two or three weeks may cause such a degree of adhesion formation that the patient is fortunate if he recovers in a year The stiffness of the fingers is not only serious in itself, but it adds greatly to the difficulty in restoring shoulder movement where some stiffness may have been inevitable The only stiff shoulders which are really difficult to treat are those associated with severe stiffness of the other joints of the limb If the elbow, wrist, and fingers are normal the patient has an incentive to use the limb, and functional activity rapidly restores movement to the shoulder But if every joint, including the fingers, is as stiff as a board, it never occurs to the patient to use the limb at all, he gives up the impossible task, and the difficulties are greatly increased The first principle, therefore, in the treatment of fractures of the clavicle and neck of the humerus, and of dislocations of the shoulder and acromio-clavicular joints, is that the patient must actively move the fingers, thumb, wrist, and radio-ulnar joints throughout their full range many times every day

Fractures of the Clavicle

Fractures of the clavicle occur most commonly in the middle third following a fall on the outstretched hand The inner fragment is displaced upwards by the sterno-mastoid, and the outer fragment is displaced downwards and forwards by the weight of the limb The fragments can only be realigned by pulling the whole shoulder girdle, and with it the outer fragment, upwards and backwards and outwards Scores of methods of immobilization have been described, and this in itself suggests that one of them is really perfect Fortunately, however, these fractures almost invariably unite firmly in a few weeks, and the thickening which may result from imperfect reduction is usually absorbed and disappears in a few months On the other hand, over-zealous attempts to maintain anatomical reduction by immobilization of the shoulder for many weeks may cause far more serious trouble from adhesion formation round the shoulder-joint

Method of Treatment—The figure of-8 bandage method is simple, and if carefully used will give excellent cosmetic and functional results The patient sits on the front of a stool, the operator standing behind with one foot on the stool and his knee between the patient's shoulder-blades A large pad of wool is placed in front of each shoulder extending into the axilla Several long bandages five or six inches wide are now applied in the form of a figure of-8, passing in front of the shoulders under the axillae and crossing between the shoulder-blades With each turn of the bandage the shoulder girdles are pulled backwards and upwards as strongly as possible without compressing the axillary vessels (Fig 1) The bandages may be stitched together to prevent slipping and it is advisable to reapply them every second or third day for the first fortnight The tension of the figure of 8 bandage prevents the outer fragment from displacing forwards, and the weight of the arm acts as a lever over the axillary pad, distracting the outer fragment away from the mid line and correcting the overriding For the first two weeks the shoulder is elevated by a triangular sling tied over the opposite side, but after that time it is left free for exercises The finger-, wrist-, and elbow-joints must be exercised frequently from the first day The figure of-8 bandage may be discarded after three weeks when there is clinical evidence of union, there is no necessity to wait for radiographic evidence, which is much more delayed

COMMINUTED FRACTURES

Occasionally the fracture is comminuted and a small fragment may be tilted out of position so that a subcutaneous spur develops These fragments may be replaced by direct pressure after the main fracture has been reduced by the figure-of-8 bandage Even if these attempts fail operative reduction should still not be contemplated The sharpest of spurs usually absorbs and becomes rounded, and if any symptoms do remain it is very much more simple to remove the spur after union of the fracture than to attempt open reduction The only indication for operation in recent fractures is the exceedingly rare complication of compression of the brachial plexus or subclavian vessels by displaced fragments

Dislocation of the Acromio-clavicular Joint

If the ligaments of the acromio clavicular joint are torn the weight of the arm displaces the shoulder girdle and acromion downwards below the level of the outer end of the clavicle If the injury is confined to the ligaments between the acromion and the clavicle subluxation of the joint results, but if there is also a tear of the ligaments between the coracoid and the clavicle still more serious displacement develops The dislocation is very easily reduced by elevating the whole arm and shoulder girdle, but it is just as easily redisplaced by the unsupported weight of the limb

Immobilization by Strapping—The limb must be kept elevated by strapping which encircles the clavicle above and the elbow below A small pad of wool is placed in the axilla, and the wrist is slung from the neck by

a collar and a cuff with the elbow at a right angle A pad of adhesive felt is placed below the elbow to protect the bony prominence of the olecranon and the ulnar nerve with a second pad over the outer end of the clavicle These two points are now pulled together by strips of brown strapping four or five feet long applied as tightly as possible (Fig 2a) While the strapping is being applied the humerus is pushed upwards to elevate the scapula and the acromion and the clavicle is pulled downwards The strapping is easily stretched by the weight of the limb so that five or six layers should be used one on top of the other It is a common mistake to apply the strapping over the top of the humerus and the shoulder-joint itself instead of over the clavicle and supraclavicular triangle (Fig 2b) In these circumstances the surgeon is attempting the impossible task of compressing the humerus in its longitudinal axis If the uninjured the muscle is felt contracting even although the shoulder is not actually moved

Method of Reduction —The head of the humerus is held in its inwardly displaced and inwardly rotated position by the tension of the subscapularis To reduce the dislocation this muscle must be slowly and gradually stretched The patient lies on a couch and the surgeon stands at his side For a dislocation of the right shoulder the surgeon takes the elbow in his right hand and the wrist in his left Strong smooth traction is applied to the humerus by pulling with the right hand The arm is now very slowly and gently externally rotated by moving the wrist outwards until the normal limit of 90 degrees external rotation is reached The limb being kept in full external rotation the elbow is brought toward in front of the chest Finally the limb is internally rotated and the hand brought over to the opposite shoulder The manipu

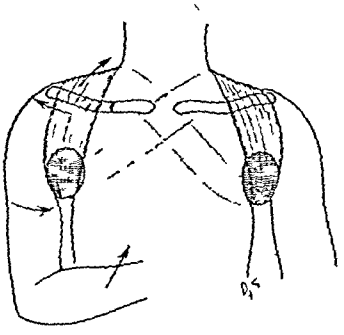

FIG 1 —Figure-of 8 bandage with large axillary pads for fracture of clavicle The outer fragment is pulled back by the bandage distracted away from the mid line by the leverage of the weight of the arm over the axillary pad and elevated by a triangular sling

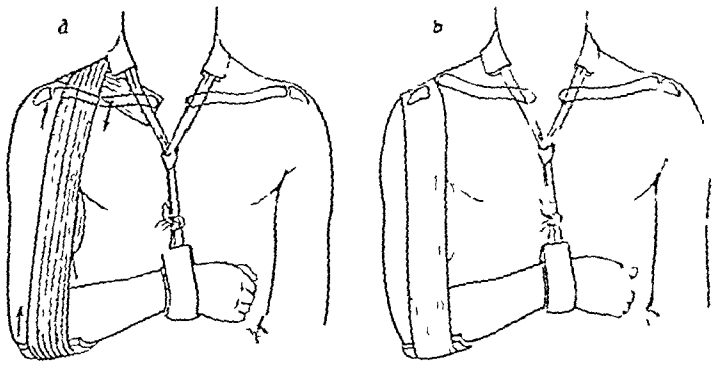

FIG 2 (a and b) —(a) Correct and (b) incorrect method of strapping acromio clavicular subluxation and dislocation The strapping must pass over the clavicle and not over the top of the shoulder It must be tightened on alternate days and retained for three to five weeks

strapping is applied in the right place and if the method is used conscientiously excellent results may always be obtained and operative measures are unnecessary It is however essential to tighten the strapping every second or third day by applying additional strips on top of the original and to continue the fixation for at least three weeks in subluxation of the joint and for at least five weeks when the joint is completely dislocated

Dislocation of the Shoulder-joint

Since the head of the humerus does not occupy its normal position immediately below the acromion process there is loss of the normal rotund outline of the shoulder The acromion is unduly prominent and there is a hollow beneath it This hollowing may not be obvious on inspection owing to the marked swelling but it is quite evident on palpation when the shoulder is compared with the normal side All movements of the shoulder are limited and painful and there is particular difficulty in putting the elbow to the side owing to the locking of the head of the humerus in its inwardly displaced position

The limb must be carefully examined for nerve injuries The deltoid muscle is often paralysed by injuries to the circumflex nerve the posterior cord or the outer trunk of the plexus The examiner palpates the muscle belly with one hand and instructs the patient to attempt abduction movement against the resistance of his other hand over the patient's elbow If the nerve supply is

lation is performed so smoothly that the head of the humerus glides into position and often the surgeon does not know at which stage the dislocation was reduced There is no necessity to elicit any click or sudden jerk Frequently such a click does not indicate successful reduction but is due to movement from one dislocated position to another It is essential that the accuracy of reduction should be confirmed not only clinically but also by radiographic examination

After treatment —A small pad of wool is placed in the axilla well powdered with talcum and a wisp of wool is similarly placed in the fold of the elbow to prevent intertrigo dermatitis The wrist is slung from the neck by a collar and a cuff and the whole limb is bandaged to the trunk to prevent external rotation movement of the shoulder The fingers hand and wrist must not be covered and these joints are constantly exercised All bandages and slings may be discarded in three weeks and the patient regains movement at the elbow joint and shoulder joint by his own exercise If the shoulder is immobilized for a shorter period there is a danger of recurrent dislocation necessitating operative treatment

Dislocation with Fracture of the Tuberosity —Radiographs may show that a large fragment of the great tuberosity has been torn off at the time of the dislocation (Fig 3) As a rule the fragment is in perfect position when the dislocation is reduced An axillary pad somewhat larger than usual may be applied but an abduction

frame is not necessary. Active movement of the shoulder is begun in three to four weeks, exactly as if there was no fracture

Dislocation with Avulsion of the Supraspinatus—In a proportion of cases the supraspinatus tendon has been avulsed from the tuberosity The complication is rarely recognized until several weeks have elapsed After the bandage and strapping have been discarded it is found that passive abduction is recovering more rapidly than active abduction A greater range of passive than of active abduction in the presence of a normally contracting deltoid is clear evidence of rupture of the supraspinatus tendon This complication was fully discussed in the preceding article (*Journal* July 2, p 30)

Dislocation with Paralysis of the Deltoid—If there has been an injury to the circumflex nerve or one of the cords the brachial plexus the paralysed deltoid muscle must relaxed by abducting the shoulder in a frame If the patient's arm is firmly bandaged to the frame but the trunk part is loose and can slide down, there is a danger that the joint may be re-dislocated For this reason some surgeons defer the application of a frame for two or three weeks but if it is skilfully applied it is safe to use it even earlier At least seven or eight six-inch bandages must be employed to fix the trunk part of the frame and to hold it up the turns of the bandage being hitched under every hook screw and bar and passed over both shoulders

Stiffness and Myositis Ossificans due to Passive Stretching—In the after-treatment of shoulder dislocations passive stretching by masseuses and manipulation under anaesthesia by surgeons must be rigidly avoided There is no more certain means of converting temporary into permanent stiffness than by permitting passive stretching It is now well recognized that myositis ossificans after dislocation of the elbow is due to passive stretching and that this practice delays the recovery of elbow movement The only pathological difference between dislocations of the elbow and dislocations of the shoulder is that the elbow is usually dislocated in children, in whom the periosteum is loosely attached, whereas the shoulder is usually dislocated in adults, in whom the periosteum is firmly attached For this reason elevation of the periosteum and 'myositis ossificans' are more often seen in the elbows of children than in the shoulders of adults The myositis ossificans is merely one evidence of the harm done to the child's elbow by passive stretching The passive stretching is just as harmful to the adult's shoulder, even although there is no outward and visible sign

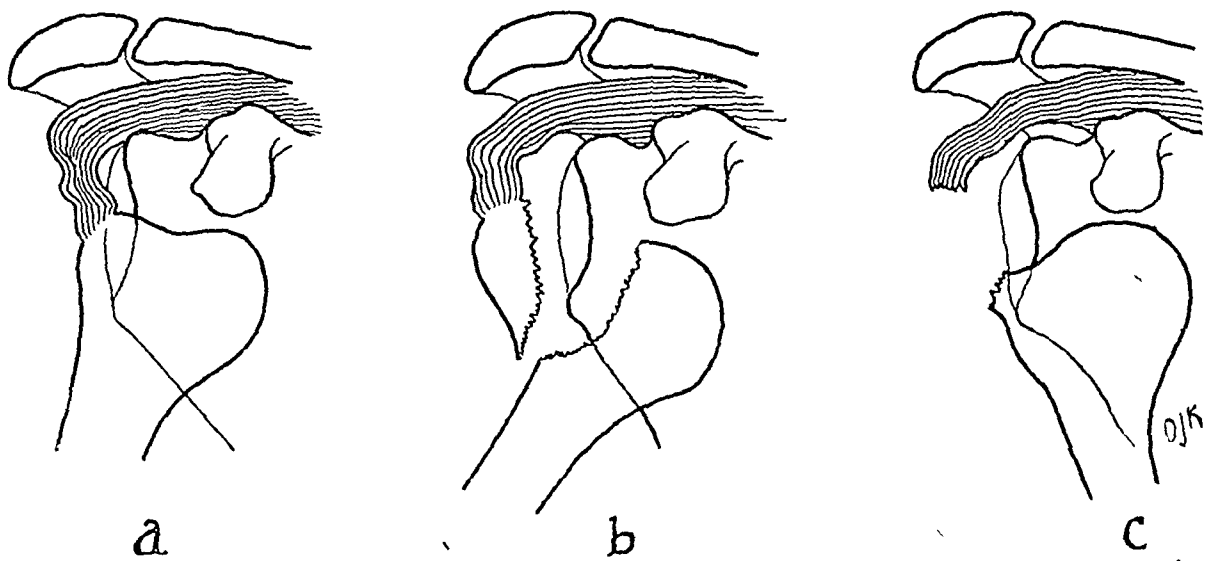

FIG 3 (a, b, c)—(a) Dislocation of shoulder (b) Dislocation with fracture of great tuberosity (c) Dislocation with avulsion of supraspinatus

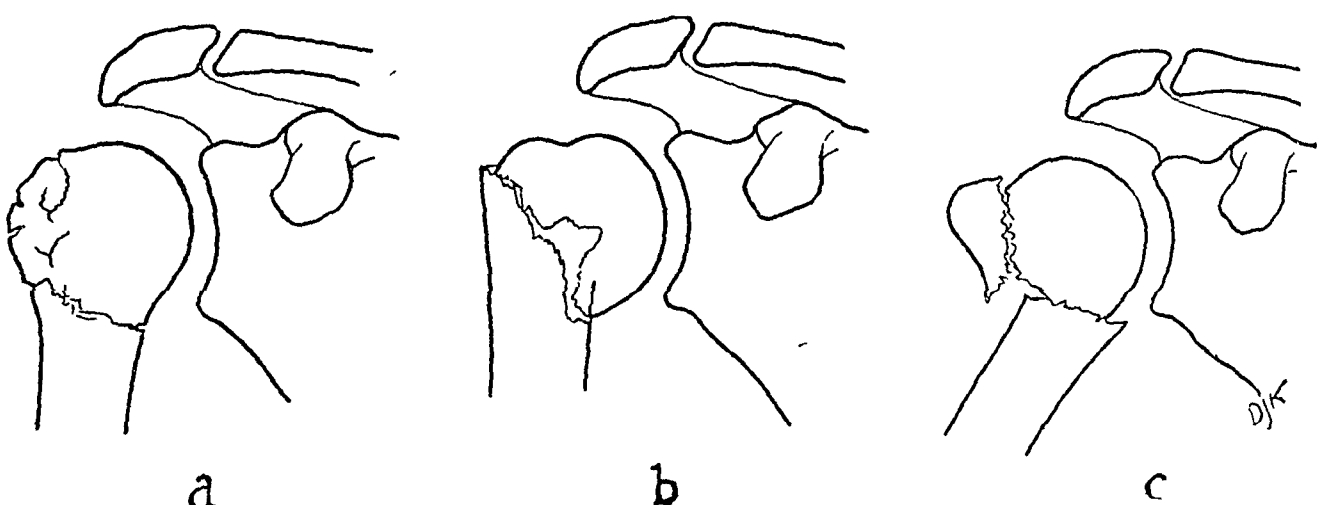

FIG 4—Three types of fracture of neck of humerus (a) contusion crack fracture, (b) adduction fracture, (c) abduction fracture

Movement must be recovered by the patient's own exercise Attempts to accelerate recovery by stretching the joint or by manipulating it under anaesthesia will have exactly the opposite effect to that which was intended

Fracture of the Neck of the Humerus

Three types of fracture must be distinguished (1) contusion crack fractures, (2) adduction fractures and (3) abduction fractures (Fig 4)

Contusion Crack Fractures—The injury follows a fall on the outer aspect of the shoulder and the crack across the neck of the humerus is often associated with a comminuted fracture of the tuberosity Complete immobilization is not necessary The limb should be supported in a sling for two or three weeks throughout which time the finger-, wrist- and elbow joints are exercised As soon as the swelling and bruising of the shoulder have begun to subside active exercises are practised

Adduction Fractures—These occur equally commonly in adults and in children, and the fragments are impacted in such a way that the shaft is adducted on the head If the displacement is not corrected abduction movement is permanently limited by a degree corresponding with the degree of angulation In elderly patients this is unimportant and the impaction should not be broken down by manipulation Treatment is carried out exactly as for contusion crack fractures In younger patients the displacement is reduced by traction on the limb in the abducted position so that the adduction angulation is corrected The limb is immobilized on a frame in right-angled abduction for four to five weeks

Abduction Fractures—It is a serious mistake to believe that every fracture of the upper end of the humerus should be treated in abduction Although an abduction frame is harmless or even advisable in adduction fractures it is the wrong treatment in most abduction fractures The shaft is already abducted on the head and an abduction frame will perpetuate or increase this displacement As a rule the displacement is not of serious degree and does not require manipulative reduction The limb is supported in a sling in the adducted position by the side of the trunk Movements of the finger wrist, and elbow are begun at once and shoulder exercises are instituted in two or three weeks

Very rarely the degree of abduction displacement at the time of injury is so extreme that the shaft is driven inwards beneath the head and completely detached from it There is now no apposition between the fractured surfaces, and the loose head is completely externally rotated and abducted by the unopposed pull of the muscles inserted into the tuberosity It may be possible to reduce the displacement by angulating the fragments on each other adducting the shaft across the chest, and pushing the upper end outwards by a hand in the axilla until the fractured surfaces engage The arm is then brought to the side and immobilized in that position for four weeks before active shoulder movements are begun

If the manipulation fails to secure engagement of the fractured surfaces the proximal fragment remains fully abducted and externally rotated It is now essential to abduct and externally rotate the distal fragment but recurrence of the original displacement must be prevented by maintaining constant traction An abduction fracture must never be treated in the abducted position unless continuous traction is applied and a special frame is employed Skin traction by adhesive strapping is all that is necessary Skeletal traction by olecranon pins should not be used The traction must be of sufficient degree to prevent inward displacement of the shaft below the head If this is not prevented the fragments will unite in this position and it will be impossible to bring the arm down to the side Frequent checking by radiographs is therefore necessary The frame is jointed so that elbow movements may be practised and the forearm wrist and finger joints must be regularly exercised

PREVENTION OF TUBERCULOSIS

NATIONAL CONFERENCE IN LONDON

The twenty fourth annual conference of the National Association for the Prevention of Tuberculosis was held last week at the British Medical Association House in London and was largely attended by delegates from local authorities and other public bodies The subjects of discussion included the organization of anti tuberculosis activities in rural areas the discovery and protection of contacts the control of tuberculosis in tropical and sub tropical regions (to which delegates from India and Tanganyika contributed), and the mental aspects of tuberculosis The conference was preceded by the annual meeting of one hundred affiliated care committees at which many suggestions were made for the employment of former tuberculous patients

The conference of which the Marchioness of Titchfield was president was opened by the Minister of Health Dr WALTER ELLIOT who quoted some statistics showing the great improvement which had taken place in the tuberculosis death rate since the middle of the nineteenth century The rate had now fallen to about one fifth of what it was then He also spoke of the multiplication of facilities for prevention and treatment In 1911 there were only some 5 000 or 6 000 beds in England and Wales available for tuberculosis cases to-day there were nearly 31 000 and nearly 150 000 persons were examined for the first time in English dispensaries last year The problem of rural housing to which he was giving personal attention was of great importance in tuberculosis prevention and the legislation passed last year for the provision of new houses and reconditioning of soundly built old cottages could be regarded as a notable contribution in this field

Tuberculosis in the Rural Areas

The first subject of discussion was the rural areas where said Dr G LISSANT COX in opening all the facilities for modern treatment isolation of infective cases with unsatisfactory home conditions education and preventive measures examination of contacts and so on ought to be available just as much as in the towns even though admittedly the tuberculosis incidence and mortality are lower in the country He stressed as of first importance co operation between the family doctor and the tuberculosis officer It was possible to measure in England at any rate the different degrees of this co operation not by notification of cases, but by the number of persons sent to the official doctor or consultant before notification for an opinion as to diagnosis In his own county (Lancashire) 92 per cent of all new cases were so dealt with Dr Lissant Cox discussed the organization of the dispensary and the institution unit in rural localities

Dr A M FRASER also stressed the importance of the general practitioner but questioned whether the general practitioner as he was turned out to-day was as well informed as he might be in these respects Post graduate training was of the utmost importance and facilities should be available to all doctors at certain intervals It seemed a pity that in the organization of postgraduate schemes for insurance practitioners local authorities were not given an opportunity to hold a stake so that the schemes could have been made more comprehensive and include an intensive study of tuberculosis

The administration of a tuberculosis scheme in rural Wales was described by Dr V EMRYS JONES Among other things, he mentioned that the inhabitants of North-West Wales—Dr Jones is tuberculosis officer for Anglesey and Carnarvonshire—were mainly a cultivated, well-read, and intelligent people, but highly fatalistic, and tending to regard tuberculosis more as a disgrace than a disease The "spes phthisica" or optimism of the tuberculous was not as evident among them as it was in their neighbours over the border The incidence of the disease was very high, the average annual rate for the last ten years being over 1,500 per million

Discovery and Protection of Contacts

In a discussion on the discovery and protection of contacts, over which Dr R A YOUNG presided, Dr G T HERBERT said that the perfunctory examination of a contact was of little value, and might even be harmful in giving a false sense of security A careful clinical inquiry must be supplemented by x-ray examination, at least screening, and usually by the taking of a film as well It was unlikely that a single examination would coincide with the date at which incipient disease first became recognizable and continued medical supervision seemed to be necessary, particularly during the susceptible age period He had discovered active tuberculosis at the thirty-seventh dispensary attendance of a contact first examined as a child some ten years before

Dr G S BANKS said that it was disappointing to have to acknowledge that even now the first introduction of the tuberculosis officer to a tuberculous household was obtained by the haphazard and variable route of the private doctor With a few exceptions—where, for instance, the doctor was swayed more by symptoms and perhaps by the knowledge of contact with an infective case in the household than by the chest signs—the average case of pulmonary tuberculosis sent to the centres was little less advanced than it was twenty years ago There should be a more general method of case-finding, a wider net should be cast All school children should be tested as a routine measure with tuberculin, and all who had reacted positively should be kept under observation by the tuberculosis officer, with whom the insurance practitioner should be associated, through the dangerous age periods of adolescence and young adult life

Dr C H C TOUSSAINT urged upon administrators and sanatorium superintendents the grave danger of returning sputum-positive cases to their homes after only comparatively short periods of treatment Prevention should be the basic policy of all the schemes, and too often prevention went by the board

Mental Aspects of Tuberculosis

At the final session of the conference an interesting discussion took place on the mental aspects of tuberculosis from the point of view both of the effect of tuberculosis on the mental life of the normal person and on the mentally disturbed patient Dr A J MORLAND asked whether people who got tuberculosis were any different mentally from those who did not Why was it that the child with pulmonary tuberculosis tended to be precocious in mind and adult in manner? It had been suggested, in explanation of the number of men of genius who had been tuberculous, that the bacterial poison could actually increase mental activity Much more likely was it that the possession of exceptional mental powers, which, as seen in writers and artists rather militated against a regulated and temperate existence, made a man more likely than his fellows to develop tuberculosis Perhaps Keats's trouble was due to the labour of his poetry superadded to the medical curriculum Again, a normal person was more adaptable to his surroundings In treatment the main problem was to get the patient to see his case in its proper perspective Many people when told they have tuberculosis start by being incredulous and refusing to accept so unpleasant a fact, others go to the opposite extreme regulate their rest hours to the exact second, and become so completely wrapped up in their symptoms and treatment that being a patient becomes their life work

Dr A W PETRIE gave an analysis of the type of major mental disorders occurring among 126 cases of tuberculosis in an institution for certified mental cases The manic-depressive type accounted for thirty-five, schizophrenia for thirty-five, and paranoid types for twenty-five It had been suggested that schizophrenia was in itself a manifestation of tuberculosis, but it was doubtful whether there was any aetiological connexion There was, however, no doubt as to a lowered resistance to tuberculosis in the case of schizophrenics, given exposure to the disease, a high proportion would contract tuberculosis There had also been shown a definite diminution of resistance to tuberculosis in the siblings of schizophrenics

On the other hand, Dr J BRANDER said that figures which he had been able to investigate showed that in reasonably favourable surroundings schizophrenics did not *develop tuberculosis in any striking degree, though their* susceptibility was suggested by the fact that six out of 106 patients submitted to pyrexial therapy by means of sulphur compounds developed pulmonary tuberculosis in fatal form within relatively short periods after the treatment In the hospital of which he was medical superintendent (Friern Hospital, formerly Colney Hatch) the post-mortem records showed tuberculosis in the middle of last century to have been the cause of death in the institution in between 40 and 50 per cent of cases At the beginning of the present century the tuberculosis death rate was 12 per cent and during the past ten years it had been 8 per cent Great changes in hygiene and improvements in dietary having taken place in the intervening period, it might be inferred that the old special susceptibility of the mentally ill to be victims of tuberculosis was a myth, and that the problem was merely one of hygiene, nevertheless he believed a certain liability persisted

Tuberculosis Death Rate in Mental Hospitals

SIR ROBERT ARMSTRONG JONES mentioned that the resident medical officer at Papworth had stated that the number of cases in that colony which had developed mental symptoms and had been sent to a mental hospital was only one in 500 over the course of twenty years At Claybury he had had experience of 16,000 insane persons, of whom 5 000 had died, and of these deaths over 800, or 16 per cent, were from tuberculosis Deaths from tuberculosis in mental hospitals had gone down enormously during the last ten years—from 6·6 to 4·5 per 1,000 patients resident In his experience at Claybury haemorrhage was very rarely seen in the tuberculous patient Both in insanity and in tuberculosis there was low resistance, also a tendency to run in families He regarded tuberculosis as a serious complication of insanity and almost, as a natural termination of chronic brain disease

Dr E RIST of Paris recalled that Laennec, writing about tuberculosis more than one hundred years ago, mentioned the importance of what he called the "sad passions meaning worry and anxiety Dr Rist had carried out a study of conjugal tuberculosis It was a striking fact that when one marriage partner was tuberculous the other rarely became so On the other hand when tuberculous husbands died or were removed to sanatoriums it was not infrequent for the widows or wives to develop tuberculosis, perhaps explainable on the ground of increased economic insecurity and responsibility for the children Dr NOEL D BARDSWELL commented upon the irritability and fussiness of sanatorium patients, though he thought this might be attributable to the segregation rather than to the disease for it was seen in other isolated colonies even of normal people

SIR PERCIVAL HARTLEY who presided said it had been claimed that just as the tubercle bacillus stimulated the

thermogenic centres and caused pyrexia so it could stimulate the higher centres to increased creative faculty It was worth remembering that Robert Louis Stevenson wrote or finished *Treasure Island* while a patient under strict regime at Davos and that John Addington Symonds did some of his best work while a patient at the same resort

The subject of the control of tuberculosis in tropical and subtropical regions was dealt with by Dr C WILCOCKS lately tuberculosis research officer to the Government of Tanganyika Territory Dr E COCHRANE of the Colonial Medical Service Major General E W C BRADFIELD of the Indian Medical Service and Dr N D BARDSWELL medical commissioner in Cyprus for the National Association for the Prevention of Tuberculosis and Professor LYLE CUMMINS discussed the general subject At the annual meeting of the National Association Dr W M MACPHAIL medical superintendent of Burrow Hill Sanatorium Colony gave a short address on the work carried out at the Colony

MENTAL WELFARE OF EX-SERVICE PATIENTS

A luncheon was given by the Ex-Services Welfare Society on July 1 at the Grosvenor Hotel following a medical conference at which the mental sequelae of head injuries sustained during the war were discussed Admiral Sir REGINALD TYRWHITT presided over the luncheon and Lord HORDER a vice president proposed the principal toast Lord Horder congratulated the Society on the work it was doing for ex service men he assured the Pressmen present that the Society was a good story In the medical sphere it was doing exactly the field work which was wanted *Laboratory research* was all very well but without observation of the patient medicine could not advance He quoted the remark of the great French physician Trousseau *Le malade toujours le malade*

Neurasthenia and Employment

Sir ADAIR HORE Permanent Secretary of the Ministry of Pensions in responding to the toast said that to-day the Ministry had 45 000 neurological cases on its books of these 29 000 were classed as neurasthenia and the remainder as mental cases some certifiable and others not epilepsies and other The original shell shock case had practically disappeared The cases of neurasthenia and other troubles such as were now encountered were in men whose mental and nervous balance was—to use a nautical metaphor—just on the Plimsoll line of safety In all treatment the occupational interest had been emphasized It was most desirable to take the patient out of the atmosphere of what had been called fireside gloom the besetting danger of the neurasthenic Sir Adair said that he wanted in the name of the Minister of Pensions to make one suggestion Great Britain had in its social system the biggest scheme of economic security yet evolved—namely social insurance of various kinds The experience of the Ministry was that the majority of the men remained within this system but a certain number tended to drift out of it and the neurological cases were the most likely so to drift If such a man got into intermittent employment he tended to lose confidence in himself It was very important to get hold of such men and if possible get them back into insurance at full benefit It was far better for such men to be in social insurance than for them to be in the insecure position of depending upon the success of an application for higher pension or for a grant from the Society A scheme had been devised in the Ministry for assisting these men to get back into social insurance

Mental Sequelae of Head Injuries

At the conference preceding the luncheon the general subject of discussion was the mental sequelae of head injuries Dr EDWARD MAPOTHER Professor of Psychiatry London University and chief consultant to the Society who presided addressed the conference at some length on this topic

Professor Mapother said that it seemed probable judging from the cases of head injury in civil life that the mental sequelae of head injuries in war had been underestimated by the Ministries of Pensions in this and other countries He proceeded to some speculations about the physical basis of those mental sequelae which were clearly organic Last summer he had analysed some 2 000 civil cases in which mental disorder of some degree was attributable to head injury These included both the cases in which the relation was psychogenic and those in which it was physiogenic Among the psychogenic cases the first group was the hysterical and the second what he called the affective cases those in which there was an outstanding deviation of mood related to the injury as an emotional experience The cases which unclassifiable had a physical basis fell from the psychiatrist's point of view into two main groups those in which there was a specialized mental disability of some kind with no general impairment and those with a generalized mental syndrome The first of these groups included conditions on the borderline between organic neurology and psychiatry It might be divided into two subgroups the first of which had a very good prognosis and the second a very bad The first included such conditions as apraxias agnosias and aphasias both motor and sensory also pure amnesia for current events There might be failure to distinguish the remote from the recent and the imaginary from what had been perceptual experience Such amnesia might coexist with perfect perception and comprehension good memory of recent events good association of ideas good reasoning insight and entirely normal conduct Such syndromes tended to clear up to a surprising degree though they might leave slight residues The second subgroup of specialized syndromes which had an exactly opposite prognosis included epilepsy epileptoid mental paroxysms and demoralization The second main group comprised of syndromes in which the mental disability was generalized In respect of these cases Dr Symonds had emphasized a principle of great importance not only for understanding them but for the theory of psychiatry in general—namely that during the progress towards normality after a head injury the mental state passed through a series of stages The total duration of mental abnormality might be an hour several months the halt which progress made at each stage was quite variable and any stage might be so protracted as to constitute a psychosis but the order remained always the same exactly the reverse order to what was observable in progressive mental disintegration due to artificial intoxication or artificial hypoglycaemia thus indicating that the syndromes or stages which could be discriminated depended upon the structure of the central nervous system and not upon the specific influence of any causal factor

Effect of Fracture of the Skull

After discussing the sequence of syndromes which seemed to correspond to stages of integration that normally succeeded one another in mental activity and describing mental activity itself as a selective balance of reciprocal activations and inhibitions between the cortex and sub-cortical centres Professor Mapother went on to point out that the degree of mental disturbance immediate or late had very important relations to the amount of damage to the skull A fracture might be present in a patient who had never been unconscious and had no subsequent mental complications On the other hand the worst results might occur in the absence of fracture Nor could all the mental complications be ascribed to haemorrhage of any kind He believed loss of consciousness to be due to disturbances of sub-cortical centres which were set up instantaneously at the moment of injury by general compression of the contents of the skull or by vibration Therefore despite the fact that it was disorder of the mental processes that was perceived it was a disturbance of basal centres that was primary The recovery of the lost ex followed according to the rule that functions involving the simpler and more primitive integrations came back first and those involving complex and more recent integrations returned last and were most apt to be left imperfect

In civil injuries, such as road traffic accidents, one commonly saw fissured fractures or comparatively localized depressed ones in war, smashing might occur by shell fragments spent bullets and high-velocity bullets fired very close It might be that the head injuries of war were less likely to start mental disturbances of the generalized organic kind because their effect was more commonly confined to the hemispheres and they were less likely to produce the instantaneous general compression of the contents which would damage basal centres Penetrating wounds by bullets of medium velocity need not be associated with loss of consciousness or retrograde amnesia, but many war wounds like those induced by a large fragment of shell or a blow on the head by a rifle butt, were liable to bring about results exactly comparable with those following civil injury

Representatives of the Services and the Ministry of Pensions participated in an informal discussion One point mentioned was that among the 200,000 people non-fatally injured in motor casualties a year the insurance companies reckoned that 4 per cent had a serious head injury There was general agreement as to the seriousness and the prevalence of minor nervous disabilities following head injury, and the opinion was expressed that many who did not have any gross breakdown were none the less incapacitated for their work owing to the injury, and that this incapacity increased as time went on

THE HUMAN SKIN

DR LEONARD WILLIAMS'S LECTURE

The thirteenth annual Macalister Lecture (in memory of Sir John Macalister, secretary of the Royal Society of Medicine) was delivered at the National Temperance Hospital on June 30 by Dr Leonard Williams The lecture was entitled 'This Mortal Coil, and in explanation Dr Williams reminded his audience that German commentators—good Shakespeareans—took the word "coil" to mean the shuffled-off skin of the snake The lecture was a provocative and delightful discourse on the skin—what Dr Williams called the largest organ of the body, and, with the exception of the brain, probably the most complicated

Physiology of Pigmentation

Those who took the trouble to trace the skin backwards in evolution, he said, could not fail to be struck by the aptitude with which Nature undertook its protection from the slings and arrows of outside attack But when the genus *Homo* was reached Nature seemed to have exhausted her protective expedients, for man had, even in individuals in whom it was most profuse only a meagre amount of hair and a capacity for producing pigment which in many cases was altogether insufficient, and it had to be remembered that from the point of view of protection hair and pigment were to some extent interchangeable

The question of capacity to produce pigment in response to solar stimulus was of great interest, and, in view of modern means of transport, was likely to grow in practical importance Why did the quite healthy young human being react so naturally to the wholesome stimulus of sunlight? The answer was not simple but it might be said that inasmuch as the laying on of colour in the skin was a physiological act demanding a great deal of energy, Nature would not undertake it except when she was obliged to do so for the preservation of the race The negro's black skin enabled him to thrive in any coloured man's country whereas in a white man's land that same black skin shut out the solar stimulus to which the negro was accustomed and to resist which he was properly equipped The real black was by no means happy in Southern Europe and in Aberdeen he was miserable not only because he could not make any money wherewith to get out but because there was insufficient sunshine to keep his physiological fires burning

Unfiltered Solar Rays

The cult of sunshine was by no means confined to nudist cranks The therapeutic value of the solar rays had been recognized for several generations What had not been recognized until comparatively recently was that, as in the case of most measures potent for good, the unfiltered rays were very potent for evil The anaemic children who were sent in shoals to the seaside every summer doubtless benefited enormously in the long run, by being subjected to the sunshine and other cosmic forces, but it was undoubtedly the case that in many instances the exposure was sudden and intensified when it should be gradual and partial The summer sun was very powerful in northern climates and it beat pitilessly upon the fully exposed skins of little children causing them to react by fever with nervous and intestinal symptoms which were usually attributed to eating raw fruit or something equally harmless Brunettes, though they might suffer in some measure, quickly acclimatized themselves by becoming swarthy, but the true blonde was seldom capable of offering effective resistance to solar onslaught If blondes in general, and especially blonde children, either were given a separate course of medicinal iron or were to increase their intake of iron-containing foods before the sun's rays became piercing there would be more harmless enjoyment of open air conditions

Compatibility of Odours

After its colour the most important attribute in the human skin was its odour, which might be very delicate and highly agreeable Undoubtedly said Dr Williams, the more delicate smells played an important though only partially recognized part in the life of the individual One succumbed to the magic of a gracious lady's charm even as she entered a room The element which decided the sympathy or antipathy in such cases was almost certainly the compatibility or otherwise of the body odours If that element could be operative in the case of perfect strangers, how much more certainly was it likely to operate in the case of married people and candidates for wedlock? Indeed it was high time means were invented for classifying people's bodily odours much as their blood groups were classified so that that powerful factor in the suitability of two people for marriage might be accorded the place it deserved In the matter of heavy odours as opposed to the delicate no serious student of the subject could be found to deny that odours irradiated from the human skin had a Freudian significance There was really no escaping the fact that the human skin was intended by Nature to be odoriferous, the odour being intensified or decreased according to the stage of life

The Facial Skin as a Record

After a brief reference to the other important functions of the skin, Dr Leonard Williams concluded by urging his audience to bear in mind that both stimuli and their reactions left a record on the skin which was not only indelible but progressive In spite of the masks which people opposed to the outside world there was nothing so revealing as the skin on a person's face—its colour, its texture, and the folds and fissures into which it was drawn by the individual's indulgences, sufferings, and emotions The skin of the face came to carry a merciless record, not only of the gross material side of existence but of the more subtle thoughts By middle age Nature had stamped upon the features the outcome of her past struggles Indeed 'the mortal coil" resembled a scroll bearing the record of the fate of the talents with which an individual had been entrusted—which of them had been used, which misused, where the individual had conquered and where faltered and, perchance, fallen

On the motion of Mr Herbert Paterson seconded by Dr H Sanguinetti Dr Williams was accorded a most hearty vote of thanks for his stimulating lecture

EXCHANGE HOLIDAY VISITS WITH FRENCH DOCTORS

We have received particulars of a scheme for improvement in the knowledge of and the relationship between the English and French peoples Few will disagree that in these times a better knowledge and understanding between our two peoples is much to be desired and in this members of the medical profession can play their part

The Scheme Outlined

Briefly the idea is that an English doctor is put into touch with a French doctor of corresponding age and position with a view to exchanging holiday visits as guests in each other's homes thus avoiding hotel and other incidental expenses which are such a costly item to the visitor abroad At the same time the visitor has in his host a reliable guide to the country The community of interest between guest and host will it is considered add to the interest of the holiday and mitigate to a large extent the difficulties where such may exist of the two languages

The organizers of the scheme have arranged with the railways on both sides of the Channel for a 40 per cent reduction in the ordinary fares to be given for the journey throughout thus reducing what is in effect almost the only cost to the visitor apart from pocket money This 40 per cent reduction also applies to wives and children

The idea is not restricted to the medical profession but is open to all the community of vocation hobby or denomination being the key to the contact established between the opposite numbers In practice the scheme operates in the following manner

An English or French secretary acting for his profession establishes a list of applicants desirous of exchanging visits with a colleague in the other country From these lists the secretaries choose to the best of their ability a suitable opposite number in each country The applicants so paired are put into touch with each other and left to make their own arrangements When dates of the visits have been decided the applicants obtain from the secretary in their own country an eligibility voucher entitling them to a ticket to their destination at a reduction of 40 per cent on the ordinary fares The visitor will be met at the foreign station by his or her host and henceforth all residential expenses will be defrayed by the host on the explicit understanding that the latter will meet with reciprocal treatment when he or she in turn becomes a visitor and guest in the other country

Information from Applicants

The scheme has already been put into practice with much success for members of various occupations The organizers will be pleased to hear from any doctors in this country who would like to take advantage of the scheme Applicants are requested to state in their letter

1 Their age

2 The desired duration of their holiday abroad with approximate dates

3 The part or parts of the foreign country (including Algeria) which they particularly want to see

4 Their willingness at the end of their holiday to return the hospitality of their host for a like period and at a mutually convenient time at their own house with approximate dates for receiving the visitor

5 The places of local interest which they can show their visitor on the occasion of the return visit or generally the way in which they propose to entertain their visitors

Letters of application should be addressed to Mr D Woodman Anglo French Exchanges Committee 27 Euston Square London N W 1

CORPORAL PUNISHMENT

Under the auspices of the Howard League for Penal Reform (Parliament Mansions Victoria Street S W 1) the letter printed below has been addressed to Sir Samuel Hoare Secretary of State for the Home Department It is signed by men and women prominent in public life and in various professions The medical signatories are Dr Alfred Salter M P Dr Havelock Ellis Lady Barrett Mr C J Bond Dr A Helen Boyle Dr William Brown Dr C L C Burns Sir William Collins Dr Ralph H Crowley Dr Letitia Fairfield Dr Kate Fraser (medical commissioner for the General Board of Control for Scotland) Dr Edward Glover Dr Thomas S Good Dr R G Gordon Mr Somerville Hastings Professor D K Henderson Dr E T Jensen Dr William Moodie Dr J R Rees Dr Jane Walker and Dr T Drummond Shiels

Letter to the Home Secretary

Three years ago we signed a letter to the then Home Secretary appealing for an inquiry into the question of corporal punishment Some of the signatories to that letter held that corporal punishment under the criminal law could not be justified on any grounds others that it could only be justified if it were proved to be essential for the protection of society

The recently published report of the Departmental Committee on Corporal Punishment has proved conclusively that it affords no better protection to society than other forms of punishment The only possible argument for its continuance therefore falls to the ground To maintain it in these circumstances implies the acceptance of deliberately imposed suffering that serves no useful purpose Such attitude is we believe foreign to the whole spirit of our penal code

We recognize with gratitude that you your self are following in the traditions of the penal reformers who believed in reformation rather than retribution We therefore confidently appeal to you to implement the recommendations of the Departmental Committee at the earliest possible date

LIFE ASSURANCE MEDICAL CONGRESS

The next International Congress on Life Assurance Medicine will be held in Paris from May 18 to 21 1939 under the patronage of the Minister of Public Health The honorary presidents are Dr P Hornig (Berlin) and Sir Walter Langdon Brown (London) The chairman is Professor M Loeper of Paris and the general secretary Dr P A Carrie 8 rue de Bellov Paris XVI The following subjects in relation to life insurance will be discussed (1) pulmonary tuberculosis (2) hyperthyroidism (3) obesity (4) addiction to tobacco (5) albuminuria and (6) the value of statistics The contribution for members of the congress who must be medical practitioners engaged whole or part time in life assurance work is fixed at 200 francs each may be accompanied by one person paying 100 francs These payments give the right to the banquet the evening parties and excursions and (for members) to a full report of the congress

The second session of the International Congress of Anthropological and Ethnological Sciences will be held in Copenhagen from August 1 to 6 under the patronage of the King of Denmark and Iceland The scientific meetings will be held at the University Seven sections have been organized physical anthropology psychology demography ethnology ethnography sociology and religion linguistics and writing The congress will be followed by a three-days excursion to places of historical interest in Denmark Arrangements for travel and hotel accommodation are in the hands of Wagon lits Cook (Thomas Cook and Son) other communications should be sent to the Secretary General of the Congress Nationalmuseet 10 Ny Vestergade Copenhagen K

Reports of Societies

CLINICAL PATHOLOGY

The summer meeting of the Association of Clinical Pathologists was held at the Nuffield Institute, Oxford, on June 25 The chair was taken by Dr A G GIBSON and more than seventy members and guests were present The special discussion on the technique of medico-legal post-mortem examinations was opened by Sir BERNARD SPILSBURY

Medico-legal Necropsies

Sir Bernard Spilsbury pointed out the importance in every case of a thorough examination of the organs of the head, neck, chest, and abdomen He referred also to conditions which rendered it necessary to examine other parts of the body, and laid emphasis on external inspection as an important part of the examination He described methods of recording injuries and of searching for hidden bruises by incision of the skin The routine method of removal of the organs, ensuring that no important structure was overlooked, might have to be modified to meet special requirements—for example, in infants he removed in one mass all the structures from the floor of the mouth to the pelvis A special dissection of the neck might be required in cases of strangulation or cut throat It was important to open up the heart while it was still attached to the lungs and to open the intestines from end to end, noting the character and distribution of their contents Finally he described the method of removal in one mass of the pelvic organs and their examination in cases such as those of abortion

Use of Fresh Preparations

Dr A H T ROBB-SMITH read a paper on the use of fresh preparations in post-mortem work He illustrated the value of these preparations in the identification of fat emboli, of pigments, and of deposits in the kidneys For the recognition of fat emboli a small snippet of lung tissue was placed on a slide, moistened with 2 per cent potassium hydroxide, and examined with a partially closed condenser diaphragm after the application of a cover-slip The pulmonary tissue was rendered transparent though the elastic fibres were not dissolved The fat was seen lying in the alveolar capillaries, either as cylinders or as droplets radiating in a fan-shaped manner The fat could be distinguished from air bubbles, since the latter had a broad dark rim with a bright centre, whereas the fat was uniformly colourless to the edge of the globule The application to fresh specimens of reagents such as acids alkalis, hydrogen peroxide, and silver nitrate enabled a distinction to be made between haemosiderin, haematoidin malarial pigment, and melanin These methods might be used also for the identification of small deposits in the pyramids of the kidney These might consist of bilirubin, acid sodium urate, sodium biurate, or calcium carbonate Bilirubin infarcts could be recognized by the characteristic rhombic or fine needle crystals and by Gmelin's reaction This was carried out by rinsing thin slices of the kidney in weak potassium hydrate then applying a cover-slip, and placing a drop of strong nitric acid at one side and drawing the solutions through with blotting paper, the bilirubin deposits changed colour from green through red to blue Uric acid infarcts had usually an amorphous form and were soluble in dilute acids without the formation of gas calcium carbonate infarcts could be recognized by the formation of needle-shaped calcium sulphate crystals on the application of strong sulphuric acid or of calcium oxalate crystals after the addition of hydrochloric acid and ammonium oxalate They were also soluble in hydrochloric acid with the evolution of carbon dioxide Gouty deposits of sodium biurate were identified by their characteristic crystalline form Dr Robb-Smith did not advocate the use of unfixed frozen sections, as these seldom supplied information which could not be obtained from a careful observation of the gross characters of the organ

Status Lymphaticus

Dr E WORDLEY opened a discussion on the subject of status thymico lymphaticus He mentioned that the older textbooks on pathology were quite definite in their descriptions of a condition characterized by enlargement of the thymus and lymphoid tissues and associated with sudden heart failure and death They accepted the association between such post-mortem findings and sudden death without any reservations, except to say that it was difficult to explain exactly how and why death occurred He then briefly discussed the findings of a joint committee on status lymphaticus, which came to the conclusion that an enlarged thymus in itself could not be considered as indicating status lymphaticus, and that there was no definite evidence of general hyperplasia of lymphoid structures in cases with an abnormally large thymus Dr Wordley then discussed seven cases in which the original criteria justifying a diagnosis of status lymphaticus were all present He gave certain figures which seemed to indicate that some cases showed an abnormal proportion of lymphocytes in films made from blood taken post mortem and suggested that this point might be further investigated He himself was inclined to the view that a diagnosis of status lymphaticus as the cause of death was justified in a limited number of cases

In the discussion which followed the general feeling of the meeting was that sudden death after comparatively trifling causes was often found in individuals with an enlargement of the thymus and lymphatic glands and hypoplasia of the circulatory system It was thought that it would be helpful if some scientific body, such as the Association of Clinical Pathologists, were to undertake a combined investigation of the cause of death in these cases and make recommendations as to nomenclature It was decided to refer the question to the Council of the Association

Before the scientific meeting at the Nuffield Institute a demonstration was arranged in the pathology department of the Radcliffe Infirmary Here Dr J G GREENFIELD demonstrated his method of removing the brain and spinal cord Dr A H T ROBB SMITH showed Graff's technique for removing the upper air passages and pharynx and Dr A G SHERA exhibited an electric rotary saw for the removal of the skull cap and exposure of the spinal cord in post mortem work

---

A meeting of the North of England Obstetrical and Gynaecological Society was held in Newcastle on June 17 Dr W R ADDIS (Manchester) described two cases of pseudo myxoma of the peritoneum with lesions in the appendix Mr ST GEORGE WILSON (Liverpool) gave an account of a case of carcinoma of the vagina secondary to carcinoma of the colon Professor FARQUHAR MURRAY (Newcastle) discussed a case of a large sloughing fibroid in a nulliparous woman associated with cellulitis and bilateral white-leg and detailed the operative treatment of a case of absence of the vagina in a girl aged 13 Dr C G PAIN (Sheffield) showed a film, *White Cells in Action* of the movement of normal leucocytes and the phagocytosing of streptococci

Local News

SCOTLAND

University of Glasgow

At the commemoration day graduation ceremony of the University of Glasgow on June 22 the Principal Sir Hector Hetherington conferred honorary degrees upon sixteen recipients of whom one Professor Matthew John Stewart is a member of the medical profession Professor Stewart graduated M B Ch B at Glasgow in 1907 and is professor of pathology in the University of Leeds and pathologist to Leeds General Infirmary He is a member of the Medical Research Council and has published various studies on pathological subjects including gastric ulcer, the cellular reactions induced by cholesterin deposits and sacro-coccygeal chordoma

Royal (Dick) Veterinary College

At the annual prize giving of the Royal (Dick) Veterinary College Edinburgh on June 27 Lord Rosebery who presented the prizes said that veterinary science was doing an enormous amount of work to ameliorate the condition of animals in this country and to help their owners He announced that the Totalisator Board which distributed a certain amount of money for purposes apart from racing had given £1 000 towards this College and the Board had also given £1 000 towards research work in connexion with grass sickness in horses The chairman Sir Thomas Hudson Beare in a short review of the work of the College during the session referred to the death of Dr Charnock Bradley the late principal who had guided its destinies for over a quarter of a century His final illness had been largely due to overstrain and overwork and the governors had decided that the new principal when appointed should be freed from teaching work He hoped within about a week to be able to announce the new principal and the new professor of anatomy

St Andrews University

At the graduation ceremony on June 30 of the University of St Andrews the Vice Chancellor Sir James C Irvine conferred the degree of LL D upon five recipients including one member of the medical profession Professor E D Adrian F R S of the Chair of Physiology in the University of Cambridge Professor Blyth Webster in presenting Professor Adrian for the degree said that he was a graduate of Cambridge Oxford Harvard and McGill and had done valuable work on the physiology of nerve and the integrative action of the nervous system By experimental work of unusual delicacy he had brought the complexities of this subject within the range of analysis for which in 1932 he had been awarded jointly with Sir Charles Sherrington the Nobel Prize in physiology and medicine Since the foundation of the Nobel Prize in 1901 out of more than eighty awards about a quarter had gone to scientific men in Britain and it was a rarer honour that both awards in the same field should have fallen to this country in one year

At the same ceremony Professor Gordon Campbell was installed in the Chair of Dental Surgery being the first professor of dental surgery in Scotland The Vice Chancellor said that the foundation of this chair was the culmination of long years of patient effort and thanks to the generosity of some public citizens in Dundee and to the enthusiasm of a group of able dental practitioners in that city the Dundee Dental Hospital had come into being and had presented an opportunity for the University to join in the new movement which had resulted in the present satisfactory position Special thanks were due to Mr William Boyd whose liberal endowment had enabled them to found this chair Twelve diplomas in Dental Surgery and two in Public Dentistry were afterwards conferred by the Vice Chancellor the recipients being the first University graduates in this department in Scotland The number who received the degrees of M B Ch B was forty six while two received the M D

ENGLAND AND WALES

The Minister of Health at Sheffield

Dr Walter Elliot Minister of Health visited Sheffield last week to open the Firth Park Maternity and Child Welfare Centre and the Coisley Hill Sewage Works which have been provided by the corporation At the opening of the new sewage works he said that the ideal of sewage engineers meant that the rivers of the country should receive only what was right to flow down them to the sea We were recovering though slowly to day from one of the worst features of the industrial revolution—namely the throwing into our rivers of untreated waste products of all kinds Purification of sewage by helping to clean our rivers was part of a bigger thing—that of preserving the countryside of being a good neighbour of preserving health and of doing what was right If everybody showed the same care and was as up to date as the Corporation of Sheffield and its ally the Chesterfield Rural District Council much more would be done to make our rivers clean Nothing could be more beautiful than a beautiful river and nothing could be more loathsome than a river which was foul polluted and dead At the opening of the maternity and child welfare clinic Dr Elliot referred to the decline in the infant mortality rate per 1 000 live births from 136 in 1885 to 58 in 1937 and to the recent decline in the maternal mortality rate The problem of maternal mortality still required however to be attacked in every possible way and much was to be expected from the recent Midwives Act and from the steps which his Department had taken following the publication last year of a report on a series of intensive investigations by medical officers of the Ministry Team work was the keynote of the attack The Firth Park Clinic marked in Sheffield the beginning of a scheme of decentralization and he commended this example to other local authorities Clinics should be established in the outlying parts of big towns so that the entire population could be served It was vital that when health services had been provided the people should be told of their existence and he congratulated the Sheffield Corporation on the efficient manner in which it had joined in the recent public health campaign and had told the people of Sheffield in no uncertain manner what it was doing for them

After care Work of the Merseyside Hospitals Council

The headquarters in Lord Street Liverpool of the Merseyside Hospitals Council is the centre of a department concerned solely with the transfer of patients from hospitals to convalescent homes and with the allied aspects of after care There is an all too prevalent impression that the work of the Council begins and ends with the penny in the pound scheme That is a vital part of its work and is the foundation of and largely the justification of its existence But it is not the whole story The Council has a variety of co ordinated activities and this after-care department is one of them Established eleven years ago it is a closely knit piece of organization doing its own specific work as an integral part of the entire activities of the local group of thirty hospitals After care has a much wider application than convalescent home treatment and it is through the work of the department's visitors to the homes of the patients—skilled and sympathetic full time social service workers—that the full

possibilities of after-care are realized These home visitors, many of whom have made a close study of social science, divide much of their time between the hospitals and the homes of the patients Their services are in constant demand, and the information they gather becomes the basis of action by the department in the way of arranging for convalescent home accommodation, or in some other way supplying the urgent needs of those who have just passed through hospital wards and are fit subjects for some form of after-care In this work of mercy medical men hospital matrons sisters and nurses co operate with the department's visitors

Health Congress at Portsmouth

Nearly fifty papers and addresses will be read and discussed during the week of the Health Congress, which opens at Portsmouth on Monday next In the section of architecture, town planning, and engineering, over which Sir Raymond Unwin presides, town planning and the safeguarding of public water supplies will be discussed Air raid precautions will be dealt with in the conference of representatives of local authorities, and in connexion with this discussion a mimic air raid has been arranged for Wednesday evening, July 13, in which the full A R P organization of the city will be seen in action Among other subjects to be discussed are rheumatism, introduced by Lord Horder, the future of the general hospital, the Food and Drugs Bill, defects found in school entrants, meat inspection, and health propaganda among natives in the Tropics During the week a Health Exhibition is being held in the Connaught Drill Hall As recorded in the *Journal* of June 25 (p 1373), the Duchess of Gloucester opened an exhibition at the Imperial Institute a short time ago of more than 200 photographs illustrating progress and activity in Kenya A supplementary series of photographs deals with some aspects of the work of the Medical Department in Kenya with special reference to the part played by Africans These photographs will be on view in Portsmouth next week at the Health Exhibition of the Royal Sanitary Institute

Welsh National Institute of Radiotherapy

The chairman of the Welsh Board of Health on June 23 convened a conference, which was attended by representatives of county councils, county boroughs, and boroughs in South Wales, and of the Welsh School of Medicine and the large hospitals, to discuss a proposal to establish a Welsh National Institute of Radiotherapy to serve the whole of South Wales The proposal is stated to have the approval of the National Radium Commission During the discussion on the scheme Sir Ewen Maclean mentioned that the Miners Welfare Fund of South Wales had donated £5,000 towards the project and the Cardiff Royal Infirmary had announced its readiness to give £15,000 from its Centenary Fund Appeal

Conditions of Nursing Service

The Interdepartmental Committee on Nursing Services which with Lord Athlone as its chairman, is investigating conditions of service in the nursing profession, is issuing a questionary to all hospitals The object of this is to obtain statistics for the country as a whole on such matters as the hours nurses have to work, the salaries they receive, and the length of their annual holidays This is the most comprehensive survey of the kind ever undertaken in this country the committee which has been receiving evidence from various bodies and associations since last January has found that its consideration of several important problems has been seriously handicapped by the lack of any general statistics Other matters dealt with in the questionary are the numbers of nurses of the various grades employed by each hospital the arrangements in operation for the training of probationers and the reasons which cause so many probationers to leave the nursing profession during their first years in the service

Correspondence

Uterine Rupture following Caesarean Section

SIR —The paper on "Uterine Rupture following Caesarean Section" by Mr C E B Rickards (*Journal* June 25, p 1359) is timely and instructive For better or for worse, Caesarean sections are being performed more frequently each year, and this late complication of the operation consequently becomes a more and more common emergency of obstetric practice

Mr Rickards quotes Eardley Holland as saying that 4 per cent of Caesarean section scars rupture during a subsequent pregnancy or labour, and this figure is now also quoted in various textbooks of obstetrics The statement is taken from Holland's analysis of the after-results of 1,605 cases of Caesarean section, published in 1921 (*J Obstet Gynaec Brit Emp* 28, 488) but, as so often happens, the sentence taken from its context is misleading and has caused many people to underestimate the frequency of this accident

The following is an abbreviated table taken from the article in question

Delivery by natural passages	78 cases
Repeated Caesarean section	352 "
Rupture of the scar	18 "

It will be seen that out of the 448 cases listed there were eighteen ruptures, which is the origin of the "4 per cent so often quoted But a little consideration will show that this figure is easily misinterpreted The majority of women in this group were subjected to a repetition of the Caesarean section (presumably before the onset of labour) and were therefore deprived of the best opportunity of rupturing their scars On the other hand, it would be equally fallacious to say that eighteen women ruptured their scars out of the seventy-eight who were delivered by the natural passages for many of the ruptures may have occurred *before* labour, and the number would therefore be artificially loaded by cases which should, in a sense, belong more rightly to the 'repeated Caesarean section" group

In short, although 4 per cent represents the proportion of women who did in fact suffer from rupture of the uterus, this figure does not represent the percentage of women who would rupture the uterus were their pregnancy allowed to go to term and to end in natural labour the actual number of ruptures can be counted, but it is impossible to find a denominator by which the real frequency of the accident may be estimated There is little doubt that the figure of 4 per cent seriously underestimates the average risk which a woman runs of rupturing her uterus during subsequent pregnancy and labour after a classical Caesarean section —I am, etc,

CHASSAR MOIR

Department of Obstetrics and Gynaecology, University of Oxford July 4

When to Start Sulphonamide Treatment in Gonorrhoea

SIR —The published results of sulphonamide treatment justify a hope that in this group of remedies may eventually be found the "606" of gonorrhoea, but it seems possible that at first their misuse may lead to an increase in its incidence As everyone with experience of this form of treatment knows, in a large number of cases of acute gonorrhoea it causes a rapid cessation of discharge, which leads the patient to believe that he has been cured

Unfortunately in a certain proportion of cases when the treatment is stopped the discharge returns as profusely as ever In such cases after resumption of treatment the same thing may be repeated a number of times and eventually the duration of the attack may be found to have been longer than it would probably have been under ordinary treatment It seems not unlikely also that when the treatment has to be resumed a number of times on account of relapse the germ may become sulphonamide resistant Further in one of the periods when such a patient sees no discharge he is apt to resume sexual intercourse, passing on the disease to his consort

For these reasons alone it seems to be most desirable that there should be agreement among practitioners as to the method of using the sulphonamide remedies which will result in the minimum of relapses after the administration of such an amount as causes the least possible proportion of toxic effects and in this connexion the point in the course of the disease at which the treatment should be started seems to be particularly important

In a discussion on sulphonamide treatment of gonorrhoea which was opened by Dr Hanschell at a meeting of the Medical Society for the Study of Venereal Diseases in October 1937 I drew attention to the views of H Felke (1937) to the effect that treatment with the sulphonamide preparation 'uleron ought not to be started for at least two weeks after the attack began otherwise the result would be indifferent He considered that in order to obtain the best effect of the remedy the tissues should have acquired some of that resistance to the gonococcus which we know is essential to natural recovery Felke's views seem to me to be supported by results previously reported by Grutz (1937) with the same remedy, and further evidence to the same effect has been afforded by other German workers notably Fischer (1937) and Schreus (1937) The latter worker recommends in fresh cases that the patient be prepared for the sulphonamide treatment by administration of gonococcal vaccine during the first six days treatment with uleron being started on the tenth My own experience with uleron here and recently in Jamaica in collaboration with Dr S E Ferreira the Island V D O supports the view that if one will wait until the attack is at least three weeks old before starting treatment comparatively little uleron (four or five days treatment) brings the attack to an end in the majority of cases, and toxic effects are very few

Using another sulphonamide remedy sulfanilamide (which appears chemically to be the same as the preparations known as sulphanilamide and prontosil album in this country) Herrold (1937) in the U S A doubted if more than one-third of acute cases would be cured in one to three weeks with even maximum doses but believed that two thirds of the chronic cases would be cured in two to four weeks with moderate doses Van Slyke Thayer and Mahoney (1937) also in a recent paper have reported results which seem to show the advantage of waiting Counting as acute all cases with infections of less than twenty eight days duration and as chronic those with infections older than this with given amounts of treatment with sulphanilamide they had fifteen failures in sixty three acute cases and only one in thirty six chronic ones

On the strength of this evidence I suggest that it is better in all cases to wait until the attack has lasted three weeks before starting treatment with any of these remedies In this period very few men indeed would indulge in sexual intercourse and the greater certainty of cure out of hand when the treatment is started then makes it possible that universal adoption of a rule to wait as suggested would result in a reduction of the incidence of fresh infections I am encouraged to hope that I may be supported in this recommendation by the knowledge that some directors of clinics in this country have already adopted such a rule I have brought the matter forward at this stage in the hope of provoking such discussion as will give practitioners clear guidance on the best method of using a very valuable group of remedies

May I add that I think that the present chemotherapy is likely to fail in any case where the local drainage is defective—I am etc

Sulphanilamide Treatment of Gonorrhoea

SIR—I should like to allude briefly to four cases illustrative of two conditions which in my opinion have resulted from the sulphanilamide treatment of acute gonococcal urethritis In each case following the accepted administration of sulphanilamide tablets with suitable local therapy the urethral discharge dried up and the urine became clear by the tenth day After a further fourteen days of local treatment only all four patients were untreated for fourteen days At the end of this time prostatic smears were examined In two of the cases there was a slight bogginess of the right lobe of the prostate which subsided with massage and the smears showed pus epithelial cells and well formed gonococci occurring both intra and extra-cellularly These tests have been repeated on several occasions during the past four weeks with very similar results and at no time has there been any reappearance of urethral discharge or haziness of the urine Such a finding would suggest prostatic latency the dangers of which cannot be overestimated

Dr A E W MacLachlan director of the Newcastle upon Tyne clinic mentioned this tendency early in 1937 in correspondence and will shortly be publishing a full account of his observations The other two cases having undergone varied provocative measures satisfactorily were provisionally discharged and told to report again in six weeks time Both returned within thirty six hours with evidence of a slight muco purulent urethral discharge and a slightly hazy first urine with threads The smear test showed a few epithelial cells fairly numerous pus cells and extracellular gonococci in large numbers I did not consider the possibility of a newly acquired infection in either case because the average incubation period in this area is five days and I have never known it to be less than two days After washing out the urethra with a weak silver solution a urethroscopic examination revealed a definite cystic littritis This had obviously existed without giving rise to the usual signs and despite provocative instrumentation it may therefore be referred to as a latent littritis

The moral would appear to be that it is most essential to examine prostatic smears repeatedly and to carry out routine urethroscopy in all cases even where there are no definite indications for such procedures The risk is infinitely better than being lulled into a false sense of security by the 'apparently dramatic cure I am

Sulphanilamide in Staphylococcal Skin Infections

SIR,—It would seem to be generally held that sulphanilamide is of little or no value in the treatment of staphylococcal infections in man, though laboratory work has shown that, in mice, the drug has some slight protective action. This unfavourable view must obviously be based on good clinical evidence, but inasmuch as this evidence may perhaps be drawn from the more serious and late cases that are treated in hospital, it appeared to me worth while to try the drug in some of the common staphylococcal infections of the skin which in the first place at all events, are seen by the general practitioner. The results in a small first series of cases are given below, and may be tentatively summarized by saying that in multiple lesions such as Bockhart's impetigo sycosis barbae, pustulous acne, and multiple boils the drug had no effect. When the infection however, was a localized one, as in carbuncles, solitary boils furuncles of the nose or of the external auditory meatus, styes, or whitlows, the results were often astonishingly good. Provided that the drug was given early before necrosis had occurred, it was surprising to see how quickly resolution took place. Boils furuncles, and whitlows generally healed in about three days and carbuncles in about seven to ten days. Where some days had elapsed before treatment was started the lesions invariably ran their natural course.

The results were particularly gratifying in infections of the upper lip, in the few cases in this series it was remarkable to observe the rapidity with which pain and swelling disappeared and to note the almost imperceptible scar that was left. Equally good results even in diabetic patients, were obtained in boils and carbuncles of other parts of the body. Furuncles were quickly aborted, and subcutaneous abscesses, after incision healed more quickly. Three patients were treated for chronic whitlows—pain, tenderness, and slight redness and swelling having existed for some three to four weeks—and all cleared up in a few days on sulphanilamide.

The dosage generally used was 1·5 to 2·0 grammes daily by mouth in tablet form. If an improvement was not manifest within a day or two no benefit was seen to result from larger or long-continued doses. Cyanosis was not observed but other of the well-known toxic symptoms were occasionally complained of; these were intense weakness, palpitation, diarrhoea or constipation, and were sometimes severe enough to make it necessary to stop the administration of the drug. The table above sets out the results in a first series of cases. They are described as good when resolution was more rapid than previous experience would have led one to expect and when there was less scarring than usual. A second and larger series is being collected, which too, so far seems to justify the more extended use of sulphanilamide in certain staphylococcal infections of the skin.

Condition	No. of Cases	Results	
		Good	Failed or Doubtful
Boils (including 2 of upper lip)	22	18	4
Bockhart's impetigo	3	0	3
Furuncles (of nose 3, of ear 3)	6	6	0
Styes	6	4	2
Carbuncles (upper lip 1, neck 3, thigh 1, chin 1)	6	5	1
Whitlows (acute 3, chronic 3)	6	6	0
Infections of hand and foot	4	2	2
Subcutaneous abscesses	3	3	0
Abscess of breast	2	0	2
Sycosis barbae	3	0	3
Acne pustulosa	1	0	1
Total	62	44	18

Some of the patients in this series were treated with Messrs. Bayer's brand of sulphanilamide—prontosil album—for a generous trial supply of which I should like to express my thanks. The rest were given sulphanilamide made by other well-known firms.

—I am, etc.,

London, E.1, June 27 M. MARCUS

The Origin of Cancer

SIR,—In a letter in the *Journal* of June 25 (p. 1394) Surgeon Rear-Admiral Charles M. Beadnell avers that my statement in a previous letter—that conjugation occurs among the cells of malignant growths—requires correction. He goes on to say on the authority of Dr. W. E. Gye that conjugation of cancer cells "is no longer believed in." My authority for stating that conjugation occurs among the cells of malignant growths is the first scientific report of the Cancer Research Fund published in 1904. There in an unsigned article which I learnt from other sources was the work of *Bashford*, the following clear description of the observed phenomenon appears. They were studying nuclear changes in young transplanted mouse epithelioma (p. 31):

'In one case towards the end of the first week nuclei are found which are drawn out into blunt finger like processes as if amoeboid (Fig. 31). One of these processes can frequently be seen applied closely to the cell wall which separates the cell from those adjoining. In isolated instances this amoeboid process of the nucleus filled with condensed chromatin, is seen closely applied to the nucleus of the adjoining cell and ultimately the two nuclei become continuous through the cell wall (Fig. 32). The process is identical with the process of conjugation in many protozoa and lower plants and probably has the same significance—namely starting a new cycle. The same phenomena have been observed in a tumour of seven weeks' growth.

He goes on to show convincingly that, though conjugation occurs rarely and is seldom demonstrated, when it is seen it is invariably associated with rapidly growing tumours and that transplants from such tumours give a very high proportion of rapidly growing daughter tumours in striking contrast to the transplants from tumours where conjugation was not observed.

I do not see how observations so clearly made and described and figured by highly competent observers can be withdrawn subsequently, as Rear-Admiral Beadnell says they were. There is no reference to them in subsequent publications of the Cancer Research Fund that I can find. Conjugation once observed cannot be got rid of by "not believing in it." That it has not been seen more often is not remarkable when one considers that a single conjugation provides the reproductive momentum for the growth and all the tissue changes of a lifetime. What other possible explanation can be given for the apparent immortality of a tumour that transplanted from mouse to mouse, produces a total mass of tissue many thousands of times the bulk of the original mouse on which it grew than the very natural explanation of periodic rejuvenescence by conjugation? *And conjugation has been observed*—I am, etc.

Ashton-under-Lyne, June 28 J. V. FIDDIAN

Cancer and Heredity

SIR—I would be obliged if you would allow me to correct a slight inaccuracy that occurred in your leading article on heredity and cancer in the *Journal* of June 18

I have never made the statement that the serum of an animal with a regressing tumour contains antibodies directed against the tumour cells On the contrary it was shown that iso haemagglutinins were formed The latter finding has been independently confirmed by Lumsden (1938) The conclusion drawn by me was that the *dominant genes* concerned in the fate of transplants of normal and malignant tissues were precisely those which determined iso antigenic differences

At the present juncture two questions concerning the antigenic structure of tumour cells and the antigenic basis of tumour transplantation demand discussion (1) Are malignant cells antigenically different from the normal cells from which they arise? (2) If such differences exist do they play a part in transplantation? There is some evidence that the answer to the first question is in the affirmative For example it is known that virus induced tumours in the rabbit or fowl will regress spontaneously (see discussion by Kidd, 1938) Furthermore it has been shown that the members of a pure line can be immunized against leukaemic cells derived from other members of the line and the immunity can be passively transferred (MacDowell *et al* 1934 Potter *et al* 1937–8) However the balance of evidence does not indicate that these differences play any part in transplantation as ordinarily carried out For reasons that were suggested in a previous communication (Gorer 1937) and that have been considerably amplified in a paper recently sent to press it would appear that the fate of transplanted tissues (normal and neoplastic) is determined to a very large extent by iso antigenic reactions—I am etc

Treatment of Apoplexy

SIR—The treatment of apoplexy by infiltration of the stellate ganglion described in the *Journal* of July 2 by Mr W A Mackey and Dr L D W Scott lends support to the theory that cerebral haemorrhage is an active rather than a passive process The passive theory is that haemorrhage results either from weakening of the vessel wall by sclerosis or aneurysm or from a sudden catastrophic rise in blood pressure such as might be supposed to occur in straining at stool or from a combination of the two

The active theory is that cerebral haemorrhage is the result of a temporary local flushing of the arterioles of the brain I venture to put forward the following suggestions in favour of the latter view

1 Massive cerebral haemorrhage is seldom a single lesion around the main mass is an area of smaller petechial spots in the brain substance These may not be noticed if the brain is cut up at once and it ought to be a rule always to harden in formalin first If this is done the petechiae are easily seen

2 High blood pressure alone is not sufficient to rupture the cerebral vessels Fineberg found that 1520 mm of mercury ruptured the cerebral vessels in only two out of thirty cadavers

3 There is a clinical association between severe portarenal epistaxis and cerebral haemorrhage I cannot give figures but I have often noticed that patients (particularly elderly women) to whom I have been called on account of bleeding from the nose subsequently died of apoplexy In epistaxis one sees a pulsating vessel surrounded by an area of engorged mucous membrane Application of the electric cautery neck the main flow and blanches the reddened area as well not necessary to touch the bleeding point merely to cover the affected area is sufficient in most cases suggesting that the action of the cautery is reflex rather than the direct effect of the vessel

4 Dramatic results in apoplexy have been reported both from venesection and from lumbar puncture—operations which must surely have a diametrically opposite effect on the intracranial pressure I suggest that both of these procedures act at all (and my own experience has not been happy in this respect) do so in a reflex manner Injection of the stellate ganglion is also an indirect method but I note that Mr Mackey and Dr Scott envisage an area of ischæmia around the haemorrhage and not an area of flushing

5 Sudden death at stool in my experience one sees after evacuation and not such as would require straining I believe that the call to stool in these cases is a symptom of the cerebral lesion and not its cause In one of my cases sudden and severe headache was followed by call to stool and watery evacuation the patient quickly lapsed into unconsciousness and died of a cerebral haemorrhage

If cerebral haemorrhage is held to be an active process it certainly suggests that indirect attacks aiming at altering the condition of the blood vessels in the vicinity of the lesion offer the best hope of success—I am etc

Voluntary Hospitals' Emergency Bed Service

SIR—I should like to express through your columns my appreciation of the recently inaugurated emergency bed service which I have found most useful in getting urgent cases into hospital

This organization is a great time saver for the busy practitioner and I feel sure that there will be plenty of demand for its services as soon as the advantages are realized Up to the present however I understand that there has been only a fraction of the inquiries that were catered for as regards office staff etc It suggests that the majority of London doctors are doubtful of the value of the new system or are so used to their former methods that they are loath to change It seems apparent that this valuable scheme for co-ordinating hospital services sponsored as it is by the British Medical Association and financially supported by King Edward's Hospital Fund deserves general support and encouragement—I am etc

London W June 28

The Unconscious Mind and Medical Practice

SIR—One of the difficulties I have always experienced in connexion with the unconscious of the psychoanalysts is that they give no precise definition of the term I am reminded of this difficulty by the following passage occurring quite early in Dr Ernest Jones's paper in the *Journal* of June 25 (p 1 Sec The apprehending of one reality is for long preceded by a period in which the mind is ruled by fantasy and an

of such a grotesque and exaggerated nature as to seem quite incredible to our conscious mind This is one feature of the unconscious ' But surely fantasy implies consciousness rob it of all consciousness and what remains?

I do not desire to initiate a controversy on this subject, but I feel that we need a precise definition of the term "unconscious as here employed —I am etc,

London, W 1, June 28 HARRY CAMPBELL

Ischio-pubic Osteochondritis

SIR —After a careful perusal of Mr G D F McFadden s able description of a case which he describes as one of osteochondritis (*Journal*, June 18, p 1309) I would suggest that it is only fair to your readers to ask him to explain why he considers that such a diagnosis should be made The diagnosis rests on clinical, pathological, and radiological findings The clinical history in any case of *osteochondritis is at best inconclusive*, and that in his reported case is not of help in diagnosis, as both trauma and infection could have originated the condition His pathological findings are not of any great assistance, but rather point to a blood-borne infection The radiological findings, in the light of reproduction in the Journal, do not suggest a condition similar to Perthes or Osgood-Schlatter s disease, as he thinks probable

The whole field of osteochondritis has in recent years been reviewed with doubt The very term "osteochondritis" is a misnomer The more modern "osteochondropathy' is preferable Within the last few years Kummel s disease of the spine has been relegated to its rightful place in the group of post-traumatic conditions, as have Kienbock's disease of the semilunar and Preiser s disease of the carpal scaphoid A few years ago all were called ' osteochondritis ' Why then should Mr McFadden add a doubtful entity to an already dubious classification? I submit that from a perusal of his case history and an examination of the reproduction of his radiograph no resemblance to Perthes' or Osgood Schlatter's disease is presented The condition rather indicates a juxta-epiphyseal lesion

I would suggest that the condition he describes is a juxta epiphysitis, as seen in other general infections or a metaphyseal ' dystrophy" similar to that shown in the rickets group (renal, coeliac or due to an avitaminosis) and I would ask him to examine his case at a later date, when the synostosis should show the broadening and shortening seen typically in the femoral neck in Perthes disease, if osteochondritis is present, or the more normal metaphyseal appearance shown in a well-treated rickets if it is not I trust that Mr McFadden will treat this note not as a criticism but as part of an attempt to simplify classification —I am, etc,

Liverpool, July 1 G EDGAR CHURCH

SIR —I was much interested in the case reported by Mr G D F McFadden in the *Journal* of June 18 (p 1309)

Last month (no doubt while Mr McFadden s article was in the press) I showed before the Orthopaedic Section of the Royal Society of Medicine some radiographs of the condition and discussed this rather unusual site for osteochondritis There was one radiograph of an adult case which revealed bulbous swellings not only at the epiphyses of the descending rami but also two at the middle of the horizontal rami The appearance strongly suggested symmetrical fracture of this part of the pelvis There was however no history of any injury or disability in youth I also showed another radiograph of an old reduced congenital dislocation of the hip joint in a child aged 6 Here the head of the *femur* was flattened and distorted, the appearance being similar to that seen in a case of healed Perthes disease, but on the same side as the hip abnormality there was an osteochondritis at the site of the ischio-pubic epiphysis on the descending ramus The usual *condition* as Mr McFadden pointed out is a unilateral ischio pubic epiphysitis without any other abnormalities

As regards symptomatology and physical signs, it is rather difficult to interpret such well-marked ones as limp, spasm of muscles, and pain in the hip Rarely is there much discomfort in Kohler's disease of the tarsal scaphoid, yet the stresses that this bone undergoes in the foot are enormous in comparison with those affecting one of the pubic bones In discussing the reasons for the occurrence of an osteochondritis of the pubis I showed a slide depicting the way in which ossifying bone growing from the body of the ischium peripherally along both the horizontal and descending pubic rami met, the ossification extending centripetally at the same time from the body of the pubis At the site of the union of these separate ossifying processes powerful groups of muscles are attached—the rectus abdominis and pectineus on the horizontal ramus, and the adductors of the thigh on the descending ramus There is also a vascular anastomosis at these sites with the pubic branch of the deep epigastric artery at the epiphysis of the horizontal ramus, and the obturator artery at the epiphysis of the descending ramus Possibly an explanation of why the normal union of the ossifying processes at the site of these epiphyses is upset is to be found in some imbalance of these three factors Certainly it is difficult to see how any other pathological theory dragging in even sepsis or tuberculosis, can be made to fit Yet in nearly all textbooks these two factors are put forward after trauma as possible causes of the analogous Perthes disease which is an osteochondritis of the epiphysis of the head of the femur —I am, etc,

London, W 1, June 27 G O TIPPLTT

Anti-venereal Measures

SIR —Dr Robert Forgan s letter on this subject in your issue of June 25 (p 1389) questions the accuracy of the conclusions of the Ministry of Health Commissioners in their recent report on ' Anti-venereal Measures in Certain Scandinavian Countries and Holland In particular the conclusion the accuracy of which Dr Forgan questions is the following

'Considering that in the countries employing compulsory treatment and in those which rely on a voluntary system the degree of success in reducing the incidence of syphilis and of relative failure in gonorrhoea are broadly similar compulsory treatment does not seem to us to be a major factor influencing the results of the anti venereal measures in the countries where it is employed

The item which Dr Forgan stresses most as a reason for questioning the accuracy of the above quoted conclusion is that according to him, England and Wales have reduced the cases of syphilis between 1922 and 1936 by less than 30 per cent, whereas Denmark has reduced the cases by 300 per cent At first this seemed to be a possible misprint but he repeats these figures again Here are his two comments on this point

'According to the Ministry of Health s official figures the number of cases of syphilis fell from 25 000 in 1922 to 18 000 in 1936—a *reduction of* less *than* 30 per cent In Denmark during the same period the figure fell from 2 400 to less than 800—a reduction of over 300 per cent While one has every respect for the clinical acumen of the personnel of the

Commission one may be forgiven for questioning the accuracy of conclusions based on the assumption that 30 per cent and 300 per cent are even broadly similar

Dr Forgan is right in saying that the decline in England and Wales between 1922 and 1936 was less than 30 per cent—actually it was 28 per cent—but the decline in Denmark on the figures he quotes was 66·7 per cent *not 300 per cent* Even so on that basis Denmark certainly achieved better results than England and Wales in that period but does that prove that our Ministry of Health Commissioners were inaccurate in stating their conclusion that as regards the countries which employ compulsory measures and the countries which employ non-compulsory measures the degree of success in reducing the incidence of syphilis are broadly similar ? If we compare the cases of acquired syphilis the rate for new infections in England and Wales in 1936 was 1·40 per 10 000 of the population (Table D p 238 Annual Report Chief Medical Officer) in Denmark the rate was 2·1 per 10 000 and in Copenhagen the rate was 5·5 per 10 000 (Table D 1 p 28 of British Commissioners Report) Even though this is in our favour does it prove anything satisfactorily to compare England and Wales with Denmark? The total population of Denmark is 3 723 000 whereas the total population of England and Wales is over 40 million The population of Copenhagen is 672 000 the population of London is over 8 million Our vast population is mostly concentrated in great cities whereas the Danish population is largely rural yet England and Wales have a rate of 1·40 per 10 000 of fresh infections in 1936 while Copenhagen has 5·5 per 10 000

Those in favour of Great Britain abandoning non compulsory measures and imposing compulsory measures may comment on these figures that Denmark notifies all cases and we do not notify so that our figures are not necessarily accurate That is true but if we look at page 23 of the Commissioners report it is obvious that the cases reported in Denmark each year do not include every case Dr Krag of the Danish State Serum Institute had evidence that 1 713 cases of syphilis *in all stages* had been tested *for the first time* in 1936 while the cases actually reported in 1935 and 1936 were respectively 834 and 835

Dr Forgan also refers to the much quicker decrease of syphilis (as notified) in Sweden between 1919 and 1935 than in this country and says that not even the most ardent supporters of our English come and go as you please methods will dare to claim anything comparable for England and Wales True they would not but can he prove with accuracy that the better results in Sweden are due to their compulsory methods? Actually it is impossible to prove anything definitely on this point on the statistics available but ought we not to realize that there are other factors to consider than the venereal statistics? First population Sweden is under 7 million total and we are 40 million Second the results of war on our enormous and largely industrialized population Syphilis rose in Sweden as a result of the war but it had nothing comparable to our problem to deal with in this respect it had 5 976 cases in 1919 the peak year for Sweden whereas we had 42 134 in 1920 which was our peak year It naturally was more difficult for this country to deal effectively with the post war health problems than it was for two small and largely rural non combatant countries such as Denmark and Sweden There is a third factor—namely the differing characteristics of nations it is doubtful if drastic compulsion would be helpful in Great Britain in the matter of venereal disease and also it might not be applied so equally and democratically between all classes and both sexes as it seems to be in Scandinavia

In any case the choice before us is to go on continuously improving our national fight against V D on voluntary methods or of abandoning our present system and going all out for compulsion In our view the latter course would do infinite damage and moreover we can see nothing in the statistics of other countries to prove that there is any reason to differ from the Ministry of Health Commissioners conclusion that compulsory treatment does not seem to us to be a major factor influencing the results of the anti venereal measures in the countries where it is employed—I am etc

Livingstone House Broadway S W 1 June 27

Anatomical Terminology

SIR—At this time of the year when professional examinations are rife the topic of anatomical terminology suggests itself The summer examinations of the Chartered Society of Massage and Medical Gymnasts have finished Students have been taught the latest possible terminology and have been told to buy the latest editions of anatomy books The second M B examinations at Oxford and Cambridge have been conducted on the Basle *Nomina Anatomica* and the second M B Part II will take place in London this week conducted in the British revised terminology The Conjoint Board examinations in anatomy are also in progress and the final Conjoint examinations are fixed for next week The utter confusion into which academic anatomists have thrown their own subject is now proving to be a serious obstacle to the mutual understanding and the education of members of the medical massage and nursing professions

It seems quite clear that the matter of uniformity lies in the hands of the examiners of these three professions and it is incredible that some are examining to more than one board and tolerating the teaching of more than one terminology So far as the medical students are concerned in London at any rate the British Revised is being taught in the anatomy schools the provincial universities vary The clinical teachers are inconsistent registrars have a knowledge of all three—the Victorian the B N A and the British Revised—and they teach a triple confusion partly for the students sake and partly to escape the wrath of the older teachers who love the more romantic names The student of to-day has to learn all three terms for any structure in order to protect himself so far as is possible from being dubbed a dunderhead by his learned clinical chief

A complete ignorance even of the B N A predominates in the massage and nursing professions so that the confusion is increasing as the students of the last decade qualify One often hears complaints that the average doctor knows nothing of modern physiotherapy and efforts are constantly being made to secure a greater co operation between doctors and physiotherapists but one difficulty is the language bar Must we teach the nerve to the serratus lateralis (the serratus magnus) as the long thoracic nerve *and* the respiratory nerve of Bell ? Will the sister in the rural department appreciate a request for a pharyngeal impure catheter?

The massage and nursing professions could be modernized at once in their teaching The medical profession itself may require more self sacrifice from the overworked clinicians than they are likely to give before the examiners have the key to the solution If men of good will

the profession were introduced to three or four new terms weekly in the *Journal* the more important items would soon be covered, but the terms would have to be in bold type I understand that the whole question of the teaching of anatomy to nurses is at present under survey by the General Nursing Council Perhaps the council will find it possible to state a policy on terminology It may be an anatomical Utopia that I am suggesting, but it affects us all It will mean that even the physicians with have to talk of atrial flutter—I am, etc,

D F ELLISON NASH, F R C S

St Bartholomew s Hospital, June 30

Tuberculin in Diagnosis

SIR—I am sorry to see that Dr J R Forbes (*Journal* June 25, p 1389) has been unable to find in my paper, to which he refers, any evidence of the diagnostic value of the subcutaneous tuberculin test Skin tuberculin tests show that in the British Isles the great majority of the adult population has been infected with tubercle, but only a small minority of the infected require treatment for tuberculosis It is as an aid in determining whether in a particular case, with symptoms and/or signs suggestive of pulmonary tuberculosis, treatment is required that I find the subcutaneous tuberculin test of great value Of course all tuberculin-positive cases require treatment, but so also do many tuberculin-negative cases

Speaking of the intracutaneous test, Dr L S T Burrell (*Recent Advances in Pulmonary Tuberculosis* 1929, p 26) says "A negative tuberculin test is by no means uncommon, and is of the greatest importance in diagnosis A positive test is of less value in diagnosis, as it indicates infection only" Now the subcutaneous test gives a much larger proportion of negative results than does the intracutaneous test, and is on that account more useful, if one may safely eliminate all the doubtful cases that do not react to this test The facts stated in my paper, published in October, 1932, which have a bearing on this and on the need for treatment of the otherwise doubtful cases that do react are as follows

'From January 1913 to March 1932 I have used the subcutaneous test in 798 doubtful cases In 344 of these there was no reaction and the patients were assured that they were not suffering from tuberculosis This does not mean that they were immune to tuberculosis for life Of 344 non reactors five did suffer later from pulmonary tuberculosis with positive sputum The 454 patients who reacted to the test doses were advised to take the matter seriously and have either sanatorium or tuberculin treatment and most of them did so From 1913 to 1922 inclusive there were 165 reactors of whom 130 got at least three months treatment at a sanatorium or with tuberculin and 35 got neither In March 1932, the condition of these was as follows

	Total	At work	Unfit	Dead
Treated at sanatorium or with tuberculin	130	87 (66 9%)	6 (4 6%)	37 (28 5%)
Treated otherwise or untreated	35	15 (42 9%)	2 (5 7%)	18 (51 4%)

As the average time that these cases were under observation was fourteen and a quarter years the deaths among those treated at a sanatorium or with tuberculin were not much in excess of those of the general population the deaths among the others being much greater

I leave it to readers to judge whether Dr Forbes is justified in dismissing these figures as 'no evidence'—I am etc,

Belfast June 28 JOHN R GILLESPIE

Medical Relief for China

SIR—Nine weeks ago you were good enough to publish a letter from us asking the profession in this country to help in the provision of medical supplies for relief work in China The response was so gratifying (£100 having been received) that we composed a second letter, more detailed than the first intending to ask you to publish it as the basis for a wider appeal However, at this juncture we were delighted to find in your issue of June 18 (p 1339) a letter signed by some of the most eminent members of our profession, describing with simple eloquence the heart breaking conditions in the war-stricken parts of China and asking for donations to be sent to the Lord Mayor s Fund for the Relief of Distress in China, 121, Westbourne Terrace, London, W 2

We feel that since this matter is now in such competent hands there is no need for our second letter to appear We have decided to hand over the sum of £100 to the Lord Mayor s Fund on the understanding that it is administered entirely in favour of the Hong Kong Division of the Chinese Red Cross Society, to help which our appeal was specifically made

A number of our colleagues have given generously We thank them whole heartedly Others have not yet responded, for them we feel bound to reiterate the urgency of the need and to commend to their notice the letter signed by some of our most distinguished brethren—We are, etc,

Schopenhauer and Syphilis

SIR—The statement made in the *Journal* of July 2 (p 22) that Schopenhauer contracted syphilis and that this disease accounted for his pessimism rests on a somewhat slender foundation This accusation was first made by Iwan Bloch, the well known syphilologist and medical historian, in a paper read before the Berlin Society for the History of Medicine and Natural Sciences (*Munch med Wschr*, 1906 **53**, 1374) mainly on the ground that some posthumous papers showed that in 1823 Schopenhauer was undergoing mercurial treatment—both internally and by inunction—associated with tincture of guaiacum, which in those days was in vogue as an anti syphilitic drug The sensual propensities of the philosopher made it seem highly probable to Bloch that he was often exposed to infection and that syphilis was the chief cause of his pessimism Professor Wilhelm Ebstein however, whose work on Schopenhauer I reviewed many years ago (*Rev Neurol Psychiat* 1907, **5**, 660), disposed of this argument by showing that Schopenhauer had been a pessimist from his youth onwards Another objection to Bloch s theory was that brought forward by J Volt (*Munch med Wschr* 1906, **53**, 1818) to the effect that the first volume of Schopenhauer s chief work, *Die Welt als Wille und Vorstellung* was published in 1818 This fact excluded the possibility of a disease contracted five years later having had any influence on the development of Schopenhauer s philosophy Moreover Ebstein points out that mercury both internally and by inunction together with tincture of guaiacum was strongly recommended by Rust, a celebrated medical contemporary of Schopenhauer s as a remedy for joint affections from which Schopenhauer suffered Similar charges of syphilis based on inadequate grounds have been brought against Voltaire and Goethe, as I have shown elsewhere—I am, etc

London, July 2 J D ROLLESTON

The Psychology of the Medical Profession

SIR—May I be allowed to thank Dr N Howard Jones for his useful contribution (*Journal* June 25 p 1391) to the problem which I raised in your issue of June 6 He appears to say in effect that the therapy advocated by the industrial chemical firms is more truly scientific and therefore more commendable than the treatment by stock *mixture so much in favour with the average practitioner* Assuming then (1) that scientific treatment of disease consists essentially in the administration of chemical or biochemical specifics and (2) that the average practising doctor is eminently suggestible I again ask Why should medical students have to study for five or six years at expensive training institutions when all the information really necessary for their practices could easily be purveyed to them by say a weekly news sheet issued by the reputable drug firms?—I am etc,

Assistance to Medical Students from Austria

SIR—The embittered protest of Dr Vincent Norman (June 25, p 1394) on the subject of assistance to medical students from Austria is perhaps not so surprising in an age when the teachings of Christ appear to be but a non-Aryan delusion but as one who frequently comes in touch with some of the refugees I would like to assure Dr Norman that he need not worry his head over the possible likelihood of enforced sacrifices on the part of himself or of his colleagues for nothing of a substantial nature has been done by anyone to help these wretched people and, indeed there is no reason to suppose that they ever will The political ramp to which Dr *Norman so dramatically refers is certainly mythical so* far as the refugees are concerned and one can only suppose that your correspondent has culled his information from a certain section of the sensational press—I am etc VICTOR CONSTAD

Medico-Legal

CHARGE OF PROCURING ABORTION

Mr Aleck Bourne at Marylebone Police Court

At Marylebone police court on July 1, before Mr Ivan E Snell Mr Aleck W Bourne obstetric surgeon to St Mary's Hospital London and consulting obstetric surgeon to Queen Charlotte's was summoned by the police on the charge of unlawfully using an instrument with intent to procure abortion Mr Bourne's defence was undertaken by the London and Counties Medical Protection Society and Mr G A Thesiger counsel appeared on his behalf The Director of Public Prosecutions was represented by Mr H A K Morgan counsel

The Charge

Mr Morgan said that this was a case of unusual character in that the defendant a surgeon very highly regarded in his profession had deliberately and openly defied the law for reasons which he thought good and sufficient On June 14 at St Mary's Hospital he procured the miscarriage of a woman by the unlawful use of an instrument The law of this country did not specifically recognize any interference with pregnancy as justifiable Such interference appeared to be permissible on two grounds only—first to save the life of the mother and secondly to save the life of the child It was not to be done for the sake of family health or other ethical reasons The defendant among other men and others held the view that the position ought to be altered or at any rate relaxed and in order to ventilate this opinion he had openly defied the and had committed a crime for which the maximum penalty prescribed *in the statute was penal servitude* for life He had been exceptionally fortunate in being able to find what from his point of view was an almost perfect case The girl was under 15 years of age and was pregnant through no fault of her own The was not the case of a loose woman who had got in the family way through carelessness or a married woman who did not want a child because it would be inconvenient It was not his business himself to discuss the arguments for or against abortion but merely on behalf of the Director of Prosecutions to ask that the case be sent for trial

The facts were undisputed On April 27 this girl then 14 years and 9 months of age was raped in a building near Whitehall The case had aroused great interest and her assailants had received long terms of imprisonment by sentence of the Central Criminal Court Following the rape the girl missed one of her periods and was taken to see Dr Joan Malleson who was a member of the medico legal council of the Abortion Law Reform Association Having seen the girl and heard the circumstances of her case she wrote to Mr Bourne who was a member of the same council and he replied

I shall be delighted to take her in at St Mary's and curette her I have done that before and shall have not the slightest hesitation in doing it again I have said that the next time I have the opportunity I will write to the Attorney General and invite him to take action On May 31 the girl was taken by her mother to see Mr Bourne a letter of consent to the operation was obtained from the girl's father and afterwards Mr Bourne saw Dr Wingate then resident obstetric officer at St Mary's told him about the case and gave him his reasons for doing what he was about to do—namely that the girl was under the age of consent and had been raped On June 6 she was admitted to St Mary's She underwent the Aschheim test for pregnancy which was positive and on June 14 Mr Bourne emptied her uterus On the same day in an interview with Chief Inspector Bridger at the hospital Mr Bourne related the facts and said I want you to arrest me The inspector said that he would report the matter to the proper authorities The only defence up to now which Dr Bourne had put in was that in his opinion as an obstetric surgeon it would be dangerous for a girl of her age to bear a full term child He did not think Mr Bourne put that forward seriously as a real defence As the law now stood if it were a defence then it might be held dangerous for any woman to go to term and the law of abortion would be a dead letter

Evidence

The girl whose name was suppressed then gave evidence Mr Morgan gave a guarantee on behalf of the Director that no proceedings against her would be brought as a result of her evidence and therefore she was not cautioned Her father however who was the next witness was told by the magistrate that there was a possibility—although almost negligible—that in answering certain questions he might lay himself open to a charge and therefore he was not compelled to answer those questions He stated that on May 31 he wrote to Mr Bourne giving his consent to the operation but he had asked that no publicity of any sort should be given to the case and Mr Bourne had replied I note what you say about secrecy and I can assure you that there will be no effort spared to keep the matter secret His reason for desiring secrecy was that the

GEORGES MARINESCO

Professor Georges Marinesco, the eminent Rumanian neurologist, known in his own country as Georghie Marinescu, of whose death a short notice appeared in the *Journal* of June 4 (p 1240), was born at Bucarest on February 23, 1863 He received his medical education at the Brancovan Hospital and then became assistant to Viktor Babes, the professor of pathology and bacteriology, with whom he collaborated in the publication of articles on transverse myelitis, hysterical mutism, and dilatation of the pupils in pneumonia At Babes s suggestion he was sent by the Rumanian Government to Paris in 1889, where he studied under Charcot at La Salpêtriere and became assistant to Pierre Marie, with whom he collaborated on acromegaly After visiting various European countries he returned to Bucarest, where in 1897 he was appointed professor of neurology in the medical faculty and head of the department for nervous diseases at the Pantelimon Hospital In addition to a monograph entitled *La Cellule*, published in 1909 with a preface by Ramon y Cajal, and articles in Gilbert and Ballet s *System of Medicine* on diseases of muscles (1910), and that of Roger, Widal, and Teissier, on trophic disorders and chronic rheumatism (1927), he was a prolific contributor to periodic literature on the finer structure of the nervous system, nerve regeneration, painful neuromata in amputation stumps, salvarsan treatment of syphilis of the nervous system, and many other neurological subjects Like his colleague the late Professor Cantacuzene, to whose memorial volume he contributed an article on rejuvenation, Marinesco was an excellent example of the saying that every man has two countries, his own and France In recognition of his contributions to French medicine he was elected a member of the Academie de Medecine and of the Societe Medicale des Hôpitaux de Paris Marinesco had also many friends in this country, where he was elected a corresponding member of the Section of Neurology of the Royal Society of Medicine in 1935 and Honorary Fellow of the Society in 1936 He worked with Mott in the laboratories at Claybury Asylum and the Maudsley Hospital, and in 1918 published an article in the Local Government Board Reports (N S 121) on the pathological histology of encephalitis lethargica The high esteem in which he was held in his own country was shown by the fact that not only was he made professor of neurology for life but also had dedicated to him by the Rumanian Society of Neurology, Psychiatry, and Endocrinology on the occasion of his seventieth birthday in 1933 a jubilee volume with a preface by Ramon y Cajal, to which contributions had been made by the principal neurologists of Europe Marinesco remained active until the end, his death taking place on May 14 within a fortnight after delivering an address on the life and work of Babes on the occasion of the celebration of the fiftieth anniversary of the opening of the first Pasteur Institute in Rumania by his old master

Dr JOHN WATTERSON MILLER who died at Llandrindod Wells on June 19, took his M B Ch B degrees in 1899, his M D Vict in 1903, and his M D Liverpool in 1904, having obtained the Cambridge D P H in 1901 He also qualified as a barrister-at-law (Middle Temple) in 1915 and was the Junior Lyon Jones Scholar During the earlier part of his career he served as plague medical officer for the Punjab Government and subsequently entered the public health services at home, first in the West Riding of Yorkshire later becoming M O H of Blackburn of the City of Hereford, and in 1921 of Radnorshire Dr F A Anderson writes The death of Dr J W Miller at the age of 62 came as a great shock to many of us who remember him so recently as an active member of the Shropshire and Mid Wales Branch of the British Medical Association As medical officer of health for Radnorshire and school medical officer he devoted himself with untiring energy to the public health services of the county, and at the time of his death was engaged on the development of the new service under the Midwives Act He was a keen and active member of the B M A, and was elected to the presidency of the Shropshire and Mid-Wales Branch in 1935 He was also a member of the Royal Sanitary Institute and a Fellow of the Society of Medical Officers of Health, serving as President of the Welsh Branch in 1933–4 Among his many interests were included the British Legion and the Boy Scout Association, to both of which he rendered valuable service Dr Miller was a man of great ability, undoubtedly well fitted for the executive work to which he devoted his life, and an excellent committeeman and chairman, indeed he was singled out for these positions in every movement with which he was associated To his widow and daughter will go out the heartfelt sympathy of a large circle of colleagues and friends

Dr EVAN WILLIAMS GRIFFITH, who died at his residence in Bath on June 4 after a long illness, had been a member of the Bath Division of the British Medical Association since 1922 He received his medical education at Cardiff and University College Hospital, obtaining the diplomas M R C S, L R C P in 1914 He served through the war in the R A M C (T) with the rank of captain He had been house-surgeon at the Bristol General Hospital Dr Griffith s later appointments included those of surgeon to the Western Dispensary and anaesthetist to the Eye, Nose and Throat Hospital at Bath He was also for some time assistant medical officer to the Monmouthshire County Council and assistant school medical officer for Newport In his youth he had been a keen athlete playing Rugby football for Christ s College Brecon, and winning many sports prizes, including the Victor Ludorum silver medal After the war he was to some extent incapacitated by illness, but he retained his athletic interests, and was a member of the Bath Rugby Football Club as well as a vice-president of the Lansdown Cricket Club He was very popular with his colleagues and a large circle of patients, many of whom attended his funeral at Westbury-on-Trym Parish Church on June 8

Medical Notes in Parliament

The Mental Deficiency Bill and the Registration of Stillbirths (Scotland) Bill were among the measures set down for consideration in the House of Lords this week

The British Museum Bill was read a first time in the House of Lords on June 30 Its purpose is to enable the Trustees of the British Museum to accept, under the will of the late Lord Rothschild, the museum at Tring and to administer as part of the Natural History Department the collections assembled there by him

On July 5 a return relative to experiments on living animals was presented to the House of Commons On the same day there were laid on the Table regulations under the Factories Act including the Night Work for Young Persons (Medical Examination) Regulations and the Protection of Eyes Regulations

The Parliamentary Medical Committee met at the House of Commons on July 5, Sir Francis Fremantle presiding, and considered a suggestion that an opportunity should be sought during the autumn for a debate on a motion in favour of a general medical service A discussion followed with Dr Copeman and Sir Morton Smart representing the Empire Rheumatism Council, and with Mr Tom Smith and Mr Parkinson M P s sitting

for coalmining constituencies The subject was rheumatism among coalminers From the discussion it appeared likely that the Miners Welfare Committee would be interested in the proposal of the Empire Rheumatism Council to establish clinics for immediate treatment of rheumatism occurring among miners The meeting agreed that it would be better to establish one experimental clinic first to prove its value for that purpose It was also agreed to ask the Secretary for Mines Captain Crookshank to receive a deputation from the Parliamentary Medical Committee the Empire Rheumatism Council and the M Ps for mining constituencies It was hoped to meet Captain Crookshank on July 12 for the purpose

Progress of Bills

The Baking Industry (Hours of Work) Bill was read a third time by the House of Lords on June 30

The second reading of the Nursing Homes Registration (Scotland) Bill in the House of Lords was set down for July 14

The House of Commons on June 28 agreed to the Lords amendments to the Street Playgrounds Bill

The Milk (Extension and Amendment) Bill was read a second time in the House of Commons this week

Milk *Permanent Legislation Postponed*

In the House of Commons on July 4, Mr W S MORRISON moved the second reading of the Milk (Extension and Amendment) Bill He explained that the Government's proposals for permanent legislation were issued in a White Paper and were in an advanced state of preparation but owing to pressure on Government business it would not be possible to pass this legislation this session The Government hoped to introduce the legislation early next session It was necessary to retain the present system of assistance to the milk industry for another twelve months and the present Bill did that The Exchequer grants were extended for twelve months and included that for the milk in schools scheme Before the scheme began about 900 000 children were receiving milk in schools and it was estimated that now about 2 750 000 children were participating Over 23 000 000 gallons of milk were consumed in England and Wales under the scheme during the year ended last September and it was likely that in the next twelve months the consumption of milk would be 25 000 000 gallons The scheme had undoubtedly proved its merits and the Government attached great importance to it

It was hoped to introduce in the autumn a scheme which had been foreshadowed in the White Paper whereby the local authorities would be able to secure milk at reduced prices for their maternity and child welfare arrangements Local authorities would thus be in a position to extend their present schemes and to make milk available to expectant and nursing mothers and to children under school age either free or at reduced prices as circumstances might require

The Bill was read a second time

Opium Imports into China

On July 4 Mr D ADAMS asked the Prime Minister whether his attention had been drawn to the reply by the Japanese delegate at the committee on traffic in opium at its meetings at Geneva during the present month to the effect that 1 500 chests of Iranian opium transported by a Japanese ship from the Persian Gulf to China were imported by the Manchukuo Government for consumption by the registered addicts of that country and if he would endeavour to ascertain whether the numbers of such registered addicts were increasing under Japanese guidance Mr BUTLER who replied said that this information was communicated to His Majesty's Ambassador at Tokyo by the Japanese Government He was not in a position to make any statement on the second part of the question nor was it likely to be possible to obtain the information desired

On July 4 Mr D ADAMS further asked the Prime Minister whether his attention had been drawn to statements by the Japanese delegate at the committee on traffic in opium that of 2 900 chests ordered by Japanese interests in the first three months of 1938 300 chests were imported by a Japanese firm through Shanghai the 2 700 chests being permitted by the North China Provisional Government in conformity with existing opium conventions and whether in view of the fact that existing conventions appeared to allow an increase import of dangerous drugs into parts of China under Japanese control the British Government would press for the most rigid interpretation of these conventions with a view to preventing a systematic demoralization of a very large number of people Mr BUTLER replied that this statement was made by the Japanese delegate at Geneva As however he declared that the Japanese firm acted solely as shipping agents no technical breach of the 1925 Convention had been committed by the Japanese Government. As also the Convention of 1931 which limited the amount of manufactured drugs that might be imported by each country during the year did not apply to raw opium the tightening up of existing regulations would not achieve Mr Adams's object.

Chemotherapy May and Baker's New Product

On July 4 Mr D ADAMS asked Lord Winterton if the firm of May and Baker Limited were obliged to refuse requests for supplies of newly discovered chemical compounds because of the dangers involved until further research had been carried out and what steps he was taking to expedite the necessary research in this and similar cases Lord WINTERTON said It is the ordinary and necessary practice in the case of new drugs that they should in the first place be subjected by specialists to carefully controlled trials as regards their value and safety to ascertain whether the medical results warrant production on a large scale for general distribution Mr Adams may have particularly in mind a new compound which is being tried in the treatment of pneumonia and about which the firm named recently published a statement that the work was still in an experimental stage The manufacturers have not so far thought it necessary to seek the aid of the Medical Research Council in this case but it is understood that the requisite investigations are in active progress

Registration of Stillbirths in Scotland

In the House of Lords on July 5 Lord ALNESS moved the second reading of the Registration of Stillbirths (Scotland) Bill which has passed the House of Commons He said that stillbirths to-day were registered by law in every civilized country with the exception of Palestine Ireland and Scotland The measure could be justified not only on statistical but on medical and humanitarian grounds

Lord DAWSON OF PENN in supporting the Bill said that every baby who died represented a failure and the cause could only be discovered by a study of the whys and wherefores of the failure In 1934 43 670 infants in England died at or soon after birth and in 1936 in Scotland it was estimated that there were 4 000 such deaths Civilization had brought down the death rate but it had also brought down the birth rate with the result that the turnover to-day was much smaller No one wanted a hopeless infant to survive but there were a number of potentially fit children who through want of knowledge and care were lost to the community The Bill would secure that more lives were saved The loss of children at or just after birth occurred in all classes of the community and was therefore in all probability due in large part to lack of knowledge In addition to obtaining more statistical information it would be of advantage if the Department of Health for Scotland would institute a close study of selected groups of children and would ask the Research Department to take action No investigation in connexion with these deaths was worth much unless post mortem examinations were carried out and it would be of value if post mortem examinations were encouraged

Lord STRATHCONA AND MOUNT ROYAL said that the Government viewed the Bill sympathetically and would welcome its passage He would bring Lord Dawson's observations on the question of research to the notice of the Department.

The Bill was read a second time

No 25

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended June 25 1938

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for (a) England and Wales (London included) (b) London (administrative county) (c) Scotland (d) Eire (e) Northern Ireland Median values for the last 9 years for (a) and (b)

Figures of Births and Deaths, and of Deaths recorded under each infectious disease, are for (1) The 126 great towns (124 in 1937) in England and Wales (including London) (b) London (administrative county) (c) The 16 principal towns in Scotland (d) The 13 principal towns in Eire (e) The 10 principal towns (9 in 1937) in Northern Ireland

A dash — denotes no cases, a blank space denotes disease not notifiable or no return available

Disease	1938					1937 (Corresponding Week)					1929-37 (Median Value Corresponding Weeks)

* 2 cases in Belfast alone

† After October 1 1937 puerperal fever was made notifiable only in the administrative county of London

‡ Death from puerperal sepsis

§ Includes primary form in figures for England and Wales London (administrative county) and Northern Ireland

EPIDEMIOLOGICAL NOTES*

Enteric Fever

Twenty cases of enteric fever were notified in England and Wales during the week under review compared with 15 in the previous week no cases were recorded in London In Scotland 6 cases of typhoid fever were notified—4 in Roxburgh County and 1 each in Ayr County and Lanark County—and 1 case of paratyphoid fever in Stirling County

Diphtheria and Scarlet Fever

In England and Wales notifications of diphtheria rose from 889 to 989 during the week under review and in London from 115 to 146 Increases were noted in Scotland and Northern Ireland but in Eire there was a marked drop in notifications Deaths in the 126 Great Towns of England and Wales fell from 29 to 22 while in London they rose from 3 to 4 Of the 22 deaths from diphtheria recorded in the 126 Great Towns 2 each occurred in Bradford (0) Liverpool (2) Wigan (0) There were 6 deaths from diphtheria in the 16 principal towns of Scotland during the week under review—4 (3) in Glasgow and 2 (0) in Edinburgh There was an increase in the number of notifications of scarlet fever in England and Wales during the week—1 765 as against 1 746—and in London where 171 cases were recorded compared with 156 in the previous week In England and Wales the figures were in excess of the median value for the last nine years but in London they were appreciably less There were 3 deaths from scarlet fever in the 126 Great Towns of England and Wales during the week under review compared with 5 in the previous week of these 1 occurred in London Notifications in Scotland fell from 383 to 355 with 3 deaths but in Eire and Northern Ireland they rose from 76 to 79 and 77 to 78 respectively

Primary and Influenzal Pneumonia

Notifications of primary and influenzal pneumonia in England and Wales fell from 787 to 758 during the week under review but in London they rose from 49 to 76 these figures were above the median values for the last nine years for England and Wales and for London There were 20 deaths from influenza in the 126 Great Towns of England and Wales during the week under review compared with 20 in the previous week while in London the number remained at 2 In the West Riding (Yorks) 103 (88) cases were notified of which 33 (27) were in Sheffield 25 (21) in the Administrative County 20 (13) in Leeds 9 (6) in Halifax In Warwickshire 39 (48) cases were notified of which 24 (29) were in Birmingham and 10 (10) in the Administrative County Of the 176 (167) cases reported in Lancashire 57 each occurred in Liverpool (42) and Manchester (42) Of the 20 deaths from influenza recorded in the 126 Great Towns of England and Wales during the week under review 2 each occurred in London (2) Willesden (0) Coventry (0) In Scotland 192 cases of primary pneumonia were notified compared with 205 in the previous week while there were 5 cases of influenzal pneumonia—as against 2 in the previous week—and 2 deaths 1 each in Greenock (0) and Kirkcaldy (0) In Eire there were 11 (17) cases of pneumonia and 7 (8) deaths 6 (6) of which occurred in Dublin There were 14 (11) deaths from pneumonia in the 10 principal towns of Northern Ireland during the week—11 (10) in Belfast 2 (0) in Portadown and 1 (0) in Larne

Measles and Whooping-cough

In the 126 Great Towns there were 10 deaths from measles compared with 14 in the previous week of these 1 (5) occurred in London 2 (0) in Barrow in Furness and 1 each in Barnsley (0) Blackburn (0) Keighley (0) South Shields (0) Tynemouth (0) Birmingham (0) During the week 422 cases were reported from the L C C elementary schools compared with 680 in the previous week The average daily admissions to the L C C fever hospitals were 18 compared with 24 in the previous week and the number of cases of measles under treatment in the fever hospitals on Friday June 24 was 860 compared with 971 on June 17 On the same day there were under treatment in the L C C fever hospitals 890 (954) cases of diphtheria 761 (776) cases of scarlet fever 26 (26) cases of whooping-cough Notifications for the week ended June 25 in the eleven metropolitan boroughs in which measles is notifiable were 241 (226) distributed as follows Bermondsey 11 (31) Finsbury 16 (27) Fulham 27 (30) Greenwich 47 (107) Hampstead 11 (17) Lambeth 6 (30) St Pancras 3 (23) Shoreditch 5 (6) Southwark 15 (12) Stepney 8 (13) In Scotland 173 cases of measles were notified compared with 208 in the previous week the figures for Glasgow were 7 (50) Dunfermline 0 (12) Falkirk 28 (43) Dundee 22 (40) Lanark County 21 (38) Edinburgh 8 (16) During the week there were no deaths from measles in the 16 principal towns of Scotland in Eire there were 2 deaths from measles in Dublin and in Northern Ireland there were no deaths

In England and Wales there were 18 (15) deaths from whooping cough during the week of which 2 (0) occurred in London In Scotland 123 cases of whooping-cough were notified compared with 119 in the previous week while there were 4 deaths—1 each in Glasgow Edinburgh Motherwell and Wishaw Hamilton In Northern Ireland 22 (34) cases of whooping-cough were recorded with no deaths

Cholera

The seasonal return of cholera was recorded at Shanghai and Swatow between May 15 and 21 and at Hong Kong and Hankow between May 22 and 28 During the week ended June 25 the number of cases notified at Shanghai rose abruptly from 66 to 319 with 39 deaths in Hong Kong 9 cases with 9 deaths were reported In the same week in Burma 10 cases with 10 deaths were notified in Calcutta 64 cases with 1 deaths in Bombay (Presidency) 66 cases with 3 deaths in Delhi 4 cases with 4 deaths In the Central Province 12 cases with 569 deaths were reported during the week under review in the North West Frontier Province 163 cases with 65 deaths in Madras (Presidency) 511 cases with 99 deaths in the Punjab 168 cases with 101 deaths in Sind 66 cases with 0 deaths and in the United Provinces 2 cases in Allahabad and 7 cases with 4 deaths in Cawnpore In French Indo China during the same week 153 cases of cholera were reported in Annam 184 in Tonking 16 in Hanoi

Plague

During the week ended June 25 in Burma 17 cases of plague with 9 deaths were reported In British India there were no cases in Bombay or the Central Provinces but in Madras (Presidency) there were 3 cases with 2 deaths

Small pox

During the week ended June 25 there was 1 case of small pox with 1 death in Hong Kong and in Shanghai 1 case with 1 death In the same week in Burma 5 cases of small pox were reported in Calcutta 26 cases with 25 deaths in Bombay (Presidency) 238 cases with 44 deaths in the Central Provinces 54 cases with 3 deaths in Madras (Presidency) 62 cases with 18 deaths in the North West Frontier Province 18 cases with 6 deaths in Sind 47 cases with 6 deaths In the same week in French Indo China 26 cases of small pox were reported in Tonking During the week ended June 18 276 cases were notified in the U S A

Typhus

During the week ended June 25 in Egypt 5 cases of typhus were reported in Cairo and 97 in the provinces In the same week 46 cases of typhus were notified in Shanghai with 13 deaths During the previous week in Morocco 166 cases with 21 deaths were notified mainly distributed as follows Marrakesh 6 cases 2 deaths Chaouia 28 cases 4 deaths 2 each in Central Atlas (6 deaths) and Dukkala (4 deaths) Rabat 17 cases Casablanca 15 cases Sous 6 cases During the same week in Tunisia 77 (102) cases of typhus were reported distributed mainly as follows Tozeur 14 Thala 13 Sfax 12 Kairwan 11 Souk-el Arba 10 Beja 5 During the week ended June 11 in Algeria 43 cases of typhus were notified distributed as follows Algiers (department) 16 cases Constantine (department) 23 In the week ended June 11 in Poland 67 (97) cases with 4 (5) deaths were reported mainly distributed as follows Polesia 23 cases, 1 death Wilno

*Except where otherwise mentioned figures in parentheses refer to the week preceding the one under review

cases Wolhynia 7 cases Brialystok 6 cases Warsaw 5 cases, 1 death, Lwow 4 cases Stanislawow 4 cases 2 deaths In Yugoslavia during the same week there were 39 cases of typhus with 2 deaths In the U S A during the week ended May 28, 26 cases were reported Georgia 15, Alabama 3 Florida 3, Texas 2, Louisiana 1 North Carolina 1, Tennessee 1

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

The Appointments Committee of the Faculty of Biology "B" will shortly proceed to appoint a University Lecturer in Anatomy, and also a University Lecturer in Physiology if a suitable candidate applies The person appointed to the latter post will be expected to take part in teaching and research in mammalian physiology, and should possess a medical qualification Further particulars of both appointments may be obtained from the secretary of the Appointments Committee, Dr F J W Roughton Department of Physiology Cambridge to whom applications should be sent by July 25

The Board of Management of the Frank Edward Elmore Fund will shortly proceed to the award of a studentship for medical research It is open to male graduates of any university in any country who were born at any place within the British Empire other than Scotland The student appointed will work in the Department of Medicine of the University of Cambridge under the direction of the Regius Professor of Physic, commencing salary £300 a year, appointment for two years in the first instance Further information may be had from the Regius Professor to whom applications together with three testimonials, a statement of previous appointments, and copies of published papers, should be sent by August 1

The Benn W Levy research studentship in biochemistry has become vacant Applications for its tenure should be addressed to the Professor of Biochemistry, Sir F G Hopkins at the School of Biochemistry before July 16

At a Congregation held on June 21 the degrees of M B, B Chir were conferred on H J Wallace

UNIVERSITY OF BIRMINGHAM

At a Congregation held on July 2 the honorary degree of LL D was conferred on Dr Robert Hutchison President of the Royal College of Physicians of London Sir Cuthbert Wallace Bt President of the Royal College of Surgeons of England, and Sir Edward Mellanby F R S Secretary to the Medical Research Council also on Viscount Nuffield Sir Bertram Ford and Mr Harry Vincent

The following medical degrees were conferred

M D—J F Shrewsbury (*ex officio*) J H Ebbs

M B, Ch B—*‡W G Mills, †‖A G Arnold †Katharine M Banks, †‖J D C Gowans, †‖D R Humphreys †P Parry, †¶A B Watson J O D Alexander, C S Ashwell L W Blundell A E Chaplin Dorothy M Cooper, T W B Cull, ‖J E B Elliott J B Farquhar, R E Gibbins, Rita Gleiberman H W Hickman J H Hicks, D B Jagger P H Kendall, Dorothy E Markham A T Marshall T J Montgomerie J F Newman G R Newns Catherine M Osler Marian L Owen, A M Wadsworth J F Wilkinson, Winifred Wynne

* First class honours † Second class honours ‡ Distinction in medicine and surgery ‖ Distinction in medicine ¶ Distinction in midwifery and diseases of women

The following scholarships medals and prizes have been awarded

A E Hills Postgraduate Scholarship in Medicine C Parsons *Queen's Scholarship* (third year), M C Binnie, (fourth year) J C White, (fifth year) P H Davison (final year) W G Mills *Ingleby Scholarship* A B Watson *Arthur Foxwell Memorial Medal Sampson Gamgee Memorial Medal* and *Russell Memorial Prize* W G Mills *Priestley Smith Prize in Ophthalmology* P Parry *Leith Neumann Prizes in Pathology* (fourth year) Medical J C White Dental I H Jones *Peter Thompson Prize in Anatomy* (third year) M C Binnie and Evelyn M Roe (equally divided) *John Barritt Melson Gold Medal in Physiology* (third year) M C Binnie

UNIVERSITY OF LIVERPOOL

[1] Second class honours Distinction in Surgery [2] Distinction in Obstetrics and Gynæcology [3] Distinction in Public Health [4] Distinction in Forensic Medicine and Toxicology [5] Distinction in Pharmacology and General Therapeutics [6] With distinction

UNIVERSITY OF MANCHESTER

Dr Rupert Sykes has been appointed warden of Ilster House and Dr S T Cowan lecturer in bacteriology

The Sheridan Delepine Fellowship in Preventive Medicine has been awarded to H L Settle M B Ch B

UNIVERSITY OF WALES

The following candidates have satisfied the examiners at the examination indicated

D P H—*Part I* Jennet Evans S H Graham Anne E M Herbert E W Kinsey Mary M M Llewellyn

UNIVERSITY OF GLASGOW

At a graduation ceremony held on July 1 the following medical degrees were conferred

M D—*R Macl Millen *J P J Paton

M B, Ch B—C A Kilpatrick, Jean D McMillan

* With commendation

UNIVERSITY OF ST ANDREWS

At the graduation ceremony on June 30 presided over by the Vice Chancellor, the honorary degree of LL D was conferred upon Edgar Douglas Adrian M D F R C P F R S Professor of Physiology in the University of Cambridge and Fellow of Trinity College

SOCIETY OF APOTHECARIES OF LONDON

The following candidates have passed in the subjects indicated

Surgery—M Becker P H Davies R E D Ellis R P Parkinson T G Vilgoen

Medicine—J Brewis I J Mathias, O Rochlin

Forensic Medicine—I J Mathias O Rochlin

Midwifery—E M E Decottignies R E D Ellis H Francis N A Jevons D Macpherson J R Rose, R Rowland on H Woolwich

The diploma of the Society has been granted to O Rochlin

The Services

EFFICIENCY DECORATION

The King has conferred the Efficiency Decoration of the Territorial Army upon Lieutenant Colonel J T Kyle and Majors D C Maclachlan J W Wayte, R G Addenbrooke and G W Wigg R A M C (T A)

DEATHS IN THE SERVICES

Major HERBERT STUART BLACKMORE O B E R A M C (ret) died at East Sheen on June 25 aged 51 He was born on July 2 1886 was educated at University College London and took the L D S R C S in 1910 the M R C S L R C P in 1911 and the D P H of the Royal Colleges in 1913 Entering the R A M C as lieutenant on July 28 1911 he became major on July 28 1923 and retired on July 28 1931 He served in the war of 1914–18 in Iraq and Afghanistan and on the North West Frontier of India receiving the O B E for his services After the war he served for seven years in the Chemical Defence Research Department Porton and afterwards in the Air Raid Precautions Department of the Home Office to which he was appointed in March 1936 He also served in 1936–7 on the British Medical Association's Committee for the Recruitment of Medical Practitioners in Time of War

Medical News

On the occasion of the forthcoming visit of the King and Queen to France the Academie de Medecine has sent its greetings to the Royal Society of Medicine and the whole medical profession of the British Empire

The next meeting of the Paddington Medical Society will be held at Paddington Town Hall on Tuesday July 12 at 9 p m when there will be a discussion on The Place of the Medical Practitioner in Air Raid Precautions Schemes to be opened by Dr N W Hammer Dr J Nairn Dobbie and Mr E W Thorn Bannister

The twentieth annual meeting of the Mental Hospitals Association will be held at the Guildhall on Tuesday July 12 at 11 a m After the Lord Mayor of London has opened the proceedings the report of the Executive Committee will be presented and difficulties in connexion with the provisions of the Matrimonial Causes Act 1937 will be discussed at the request of the visiting committee of the Durham County Mental Hospital Dr Edward Larkin will then read a paper on insulin and cardiazol treatments of schizophrenia

The French Association for the Advancement of Science will meet in Paris from September 22 to 27 under the presidency of Professor Guilhermond Further information can be obtained from the secretary 28 Rue Serpente Paris

The report for 1937 of Papworth Village Settlement will be presented at the Park Lane Hotel Piccadilly W on Tuesday July 12 at 3 15 p m The Marquess of Willingdon chairman of Papworth will preside and a new Papworth film will be shown Communications should be addressed to the Organizing Secretary Papworth Village Settlement 16 Grosvenor Place S W 1

Dr W J Vickers and Dr Carol Sims (Inner Temple) and Dr C F Brockington (Middle Temple) were called to the Bar on June 29

The issue of the *Bulletin de l Office International d'Hygiene Publique* for May contains articles on the epidemiology of poliomyelitis supply of infecting material for malariotherapy in England and Wales prophylaxis of tuberculosis in schools in England and Wales France and Germany legislation concerning tuberculous teachers in Norway and comparative rural and urban mortality in France in 1933

Several cases of psittacosis have recently occurred at La Rochelle so that the exhibition and sale of parrots have been prohibited there

Immunization against diphtheria with anatoxin has been made compulsory in Hungary for all children aged from 2 to 6 years and in France for all children in the second and third years of life

The New York banker Mr W Child has left the University of Yale ten million dollars for cancer research

Dr F de Quervain the well known professor of surgery and director of the surgical clinic at Berne will retire this year and be succeeded by Dr Hermann Matti

Thirty radio coast stations of the United States are provided with a doctor to give medical advice to passing ships

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR BRITISH MEDICAL JOURNAL B M A HOUSE TAVISTOCK SQUARE W C 1

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Secretary B M A House Tavistock Square W C 1 on receipt of proofs Authors overseas should indicate on MSS if reprints are required as proofs are not sent abroad

All communications with reference to ADVERTISEMENTS should be addressed to the Advertisement Manager Orders for copies of the *Journal* and communications with reference to subscriptions should be addressed to the Secretary B M A House Tavistock Square W C 1

QUERIES AND ANSWERS

Case for Diagnosis

FAG has a patient aged 77 He is of spare build and has been very active all his life Twenty years ago he suddenly became alarmed at a constant worrying colic which appeared on sitting down but disappeared when walking It disappeared as suddenly as it came Twelve years ago this condition reappeared palpation auscultation and a variety of x ray examinations revealed nothing The tongue is clean but there is some anorexia Except for some constipation—relieved by salines—there is no evidence of obstruction Three weeks ago these symptoms recurred and the same investigations have been undertaken with the same negative results It should be added that the patient has been a martyr to many forms of rheumatism fibrositis etc Fag asks for suggestions as to diagnosis and treatment

Recurrent Ulcers

Mr C A MOORE (Bristol) writes I should have no hesitation in offering to "Borderer" (*Journal* July 2 p 51) the suggestion that the mysterious ulcers he describes are artefacts In two similar cases of my own each patient indignantly denied having tampered with her tissues but in neither case was there any further ulceration after she discovered the game was up "Borderer" may well earn the admiration real but unexpressed of his patient for being astute enough to make the correct diagnosis

Income Tax

Additional Expense of Residence

'CLAIM holds an appointment under the terms of which he must reside in the borough of X The only house available there costs him £30 a year more in rent than one otherwise quite as suitable in a neighbouring borough Can he claim to treat that £30 as an expense of his office?

*** 'Claim is assessable under Schedule E and the allowance under that schedule is very restricted—that is to "expenses wholly, exclusively, and necessarily incurred in the performance of the duties of the office There is of course a debatable field with regard to which Rowlatt, J said (in Nalder v Walters) 'it is the duty of the Commissioners to watch claims of this kind very carefully' The point raised by our correspondent has not been dealt with specifically in the courts and he might succeed before the Commissioners, but we think that that prospect is not a good one

Replacement of Medical Instruments

'PRACTITIONER inquires 'whether the full cost replacement of a medical instrument by one more up to date and four times as expensive is allowed'

*** The cost of *replacement* is allowable, but not the cost of *improving* the equipment—the latter expense represents further capital outlay and not running costs of the practice Where a single transaction includes both elements—as in the case put by Practitioner—the total net cost must be divided and the replacement portion only allowed That amount would usually be the cost of a similar instrument at the time the new one was purchased, less the amount, if any, obtained by its sale

Irish Free State—Savings Certificates

MEDICO is residing and has always resided in the Irish Free State He asks whether he is liable to income tax there in respect of the additions accruing on British War Savings Certificates, and if so when the liability becomes effective

*** The interest—for the annual accretions are of the nature of interest—to such certificates are specifically exempted from British income tax, but would be liable to Irish Free State tax in the hands of a resident there We agree with Medico that as the interest cannot be drawn without the encashment of the certificate itself, it does not arise to the holder so as to make him liable to assessment until the certificate is cashed In that respect it is analogous to interest accruing on deposit receipt—the Scottish form of bank deposit—which is not liable to assessment until it is uplifted"

Earned Income Relief

'S J asks what is the basis on which earned income relief is calculated If, for instance the gross earnings of a practice are £1 600 the expenses £900 and wear and tear allowance £100 is the one fifth based on £1,600, £700, or £600?

*** On £600 The matter is governed by Sec 15 of the Finance Act 1925 which provides for a deduction from the amount of his earned income of a sum equal to one fifth of the amount of that income Any other basis would be at variance with the phrase of that income

Life Insurance Relief

LONICERA took out an endowment policy on April 2 1938, and inquires which is the earliest financial year for which he can obtain income tax relief

*** The year ending April 5, 1938 The local inspector should be informed at once so that the appropriate deduction can be made from the second instalment of tax now becoming due

LETTERS, NOTES, ETC

Sterilization of Hypodermic Needles

Dr O ECCLES (London W 12) writes with reference to Dr J Sandison Crabbe's letter in the *Journal* of May 14 (p 1070) I recently adopted the boiling olive oil and bread crumb method which Sir Almroth Wright showed me many years ago and to my surprise I found that the solder of the needle melted The firm that had supplied the needles then informed me that the metal lining had a melting point of 215° C and advised me to use a thermometer and not to allow the temperature of the oil bath to exceed 160° C, but difficulties in the way of high temperature thermometry prevented me from following this advice It would be more convenient to employ a liquid with a boiling point of about 160° C, but I cannot think of one suitable for the purpose Alternatively some other indicator than a bread crumb might be employed I have not tried the method of sterilizing the syringe with boiling oil for fear of cracking the glass, and I should explain that I immersed the needle in a small oil bath Is there not also a risk of melting the soldering material when a platinum needle is flamed?

Histidine in Peptic Ulcer

Dr SEYMOUR W DAVIES (Wallasey) writes After reading Dr A H Douthwaite's remarks on the treatment of peptic ulcer by histidine (*Journal* May 28 p 1143) I am tempted to record a case A man in his fifties had had symptoms suggestive of duodenal ulcer since 1923 He had undergone x-ray examination four times but definite signs of ulcer were lacking though his gall bladder was said to be pathological Upon the advice of a consultant he was treated dietetically and medicinally as for an ulcer In 1936, after the radiologist had reported duodenal irritation with a normally emptying stomach he was started upon a twenty one day course of histidine with the approval of the consultant After thirteen doses he said that he was no better but suddenly began to improve, and, on completion of the course said that he had never felt better In September 1937 he had a recurrence of pain etc and it was arranged that he should be x rayed on September 17 Late on the night of September 16 at operation a perforated duodenal ulcer was found near the pylorus After a somewhat stormy convalescence he recovered he is now about 65

Death from a Wasp Sting

Surgeon Commander A E P CHEESMAN R N writes from H M Dockyard Malta With reference to Dr F Alexander's letter in the *Journal* of June 18 (p 1348) I would suggest that the cause of death may have been anaphylaxis While in the West Indies a few years ago a doctor a friend of mine told me that he had found a man unconscious by the side of the road there was no apparent cause for this Eventually the man recovered and stated that a bee had flown into his open mouth and had stung him The mark of the puncture was on the inner surface of his lower lip without any obvious swelling So far as I can remember the man explained that he had had a similar seizure some years before when stung by a wasp and that he had trouble with injections under his skin' There was no added cardiac disease or hyperpiesis in his case

Aspirin Poisoning

Dr M C ANDREWS (Wembley) writes The note by Dr F Biddle in the *Journal* of June 25 (p 1365) reminds me of two cases of aspirin poisoning which I saw about ten years ago In each case the patient claimed to have taken 625 grains of aspirin Both patients recovered completely in a few days after a short period of restlessness sweating thirst nausea and oliguria There may be something in the claim that the potency of different makes of aspirin varies!

Disclaimer

Dr J NEIL LEITCH writes I notice that my name was mentioned in a certain case which came before the General Medical Council recently and was reported in your *Supplement* I had no connexion whatever with the rheumatism clinics mentioned I met one of the gentlemen named on three occasions of short duration during which some general conversation took place The other gentleman I met twice merely telling him of an opening which he might care to avail himself of I deny absolutely the whole story put forward in the case so far as it concerns me The newspaper report quoted in the case did not refer to me in any way

We have just received a well prepared booklet on sex hormones in gynaecology and obstetrics issued by the British Drug Houses who will supply the booklet on application

KEY TO CURRENT MEDICAL LITERATURE

GENERAL JOURNALS

Deutsche Medizinische Wochenschrift

Berlin — vol. 64 — April 9, 1938

Various Clinical Types of Haemorrhage: Hints on Recognition of a Liability to Thrombosis.—R. Jurgens.
Forensic Significance of Haemorrhagic Diathesis in Childhood.—G. Schrader.
Operations and Pregnancy.—A. Benthin.
Winter Peak of Diphtheria due to Diminution of Specific Immunity.—E. Haesler.
Carbon Monoxide Pseudo-haemoglobin: Late Demonstration of Carbon Monoxide Poisoning and Action of Carbon Monoxide on the Animal Organism.—G. Barkan.
Unusual Course of a Breslau Enteritis with a Sudden Late Death.—K. Riethmuller.
Instillations for Acute Middle-ear Inflammation.—K. Ganter.
New Views on Consumption of Alcohol and Capacity to Work.—J. Faig.
Virus Diseases.—E. Gildemeister.
Experiments on Living Animals.—H. Neupert.
Right to Work in a Doctor's Home.—C. Lommel.

Haemorrhage.—It is clinically possible clearly to distinguish from each other six different types of haemorrhage. There are those due to vitamin deficiency and to haemophilia and those which may be classed as thrombopathic thrombopenic capillary toxic or hormonal in origin.

Diphtheria.—No confirmation is found of the Gallenkamp theory that the winter peak of diphtheria is due to a diminution of specific immunity. The fundamental causes of this peak remain as obscure as those of the late summer peak of poliomyelitis.

Journal of the American Medical Association

Chicago — vol. 110 — April 30, 1938

Statistics on Deaths from Rheumatic Heart Disease.—H. L. Lunn and O. F. Hedley.
Post-operative Coronary Occlusion.—A. M. Master, S. Dack and H. L. Jaffe.
Basal Anaesthesia: Evipal Soluble by Rectum.—A. E. Jones.
Emergency Treatment in Asthma.—G. L. Waldbott.
Lop Ear.—D. W. MacCollum.
Obesity in Adolescents.—H. Gray.
Action of Hypoglycaemia on Central Nervous System.—E. Geilhorn.
Tuberculosis Epidemic: Sixty-four Cases.—T. L. Ferenbaugh, L. Segal and H. A. Schulze.

Adolescent Obesity.—Obesity in adolescents is being treated often indiscriminately according to Gray by pituitary or testicular extracts. In certain cases good results are obtained but it should be remembered that this may be due to natural causes and not the injections and that deleterious by effects may occur. Diets for obesity of carbohydrate 80 grammes protein 60 grammes and fat 40 grammes daily have given excellent results.

Klinische Wochenschrift

Berlin — vol. 17 — April 30, 1938

Vitamins and Premature Senility.—W. Kollath.
Variability of Automatic Vasomotor Regulation.—W. Fahrenbach and H. J. Oettel.
Collapse as a Result of Erect Posture.—R. Janzen.
Fatigue-electrocardiogram in Children.—P. Laurentius and K. Schuler.
Influence of Acetone on Oxybutyric Acid Content of the Blood.—M. Emmerich and F. Pollak.
Elimination of Potassium and Sodium by Diseased Kidneys.—H. Sedeke and R. Herbst.
Elimination of Ceramine in Animal.—M. Hartmann and H. Iler.
Value of Precipitation Reaction for Demonstration of Adulteration of Human with Animal Milk.—H. Urbach.
Dysentery Bacilli and Targesin.—H. Lippelt.
Japanese Contributions to Study of Regulation of Blood Supply to Central Nervous System.—F. Hoff.

Dysentery.—Targesin (a complex colloidal diacetyl tannin silver albumen compound) has been tried in two cases of bacterial dysentery with remarkable success. The preparation when given by the mouth was well tolerated the general symptoms cleared up in a few days.

Lancet

London — vol. 231 — April 16, 1938

Malignant Hepatic Jaundice.—A. Ellis.
Nutrition and the Nervous System with Special Reference to Pernicious Anaemia and Subacute Combined Degeneration.—C. C. Lucas.
Treatment of Meningococcal Meningitis with Sulphapyridine.—T. Cramer and G. B. Fleming.
Action of Testosterone Propionate in the Female.—G. L. Foss.
Unusual Case of Lead Poisoning.—J. N. M. Chalmers and S. L. Thompson.
Prevention of Complications during Gold Therapy in Tuberculous Arthritis.—K. Secher.

Complications of Gold Therapy.—According to Secher toxic symptoms arising during treatment with gold of tuberculosis and arthritis are not due to the metal but to the liberation of toxins from the lesion itself. After explaining his reasons for this belief he states that toxic reactions can be prevented or checked by the energetic administration at the same time as the gold of vitamins A, B, B, and C. In 150 patients so treated he has seen no case of thrombopenia and two only of dermatitis.

*Condition of Cervix on Vaginal Examination A True Index of the End of Pregnancy —R S Titus
An Unusual Case of Gout in a Woman —J A Halsted

Cancer —As the result of an extensive statistical study, Lombard considers that individuals among whose immediate relatives cancer has occurred have a slightly greater chance of contracting the condition than has the remainder of the population The difference between the two groups is not sufficient to cause undue worry, but further statistical studies are desirable

Cervix in Pregnancy —Titus urges the advisability of routine vaginal examinations in the last few weeks of pregnancy This is a safe procedure when properly performed When labour is imminent the cervix is an obliterated soft patulous organ this condition of the cervix is the only index upon which induction should be based and the only true index of the end of pregnancy

Paget's Spinal Osteodystrophy.—The cases illustrated include (1) fusion of bodies and arches of cervical vertebrae with radicular pain (2) gibbus and fused thoracic vertebrae (3) spastic paraplegia from advanced thoracic vertebral Paget's disease. Pathological fractures occur at a much earlier stage when porosis predominates over sclerosis.

Lumbar Ganglionectomy for Post-phlebitic Pain.—Leriche describes a special extraperitoneal approach to the first lumbar ganglion which he has removed with lastingly good results in three cases in which very severe crural pain accompanied by cutaneous atrophy threatening ulceration followed phlebitis dating some years back. On the other hand no operative treatment he finds permanently relieves post-phlebitic ulceration.

Patellar Osteochondritis.—Glanzmann describes the essential features of juvenile osteochondritis of the patella which was described independently by Larsen and Johansson in 1921. Both their patients had in addition Schlatter's disease of the tibial apophysis. Other cases in the literature are summarized. Some were complicated by Perthes's disease. A cousin of Glanzmann's own patient with patellar osteochondritis had Schlatter's disease; the cousin's father had cartilaginous exostoses of the lower ends of the femora. The clinical signs and relation to trauma are discussed.

Ultraviolet Irradiation in the Treatment of Gonorrhœa.—V. Gerner.

Diagnosis of Gonorrhœa.—A study of the material available at the Rigshospital in Copenhagen showed that inadequate use is still made of a careful history record of symptoms, bacteriological examination of the discharge from the cervix and urethra, and of the complement-fixation test. In spite of the general agreement as to the great diagnostic value of this test in gonorrhœa it is still the exception rather than the rule for it to be applied to just those cases in which it would be particularly valuable—namely those in which other evidence of gonorrhœa is doubtful or inadequate.

Post-operative Phlegmonous Gastritis.—M. Persson.
Back and Dislocation of Atlas-Axis Joint with Fracture of Odontoid.—G. Sundelin.
Spina Bifida: Prognosis and Heredity.—S. Hinderson Nielsen.

Spina Bifida.—The author's material consists of 357 cases collected from Danish hospitals. The prognosis and pathogenesis of the disease were investigated. Only meningoceles should be submitted to operation and as a rule the children should be transferred to neurosurgical department. It is very probable that a complicated hereditary factor plays an important part in the causation of the condition.

Problem of Causes of Stillbirth.—Ethel C. Dobbin, Elizabeth C. Tarbell, Edith F. Daly, and Clara E. Hayes.
Extent and Seasonal Variations of Intermittent Growth.—C. E. Turner and Alfred Nordtvedt.

Qualifications of Health Officers.—A survey of medical and other qualifications held by whole-time and part-time medical officers in counties districts large cities and small cities. A large proportion of men have medical degrees only and no public health qualification. Some (up to 8 per cent. in two groups) have no degree at all others hold degrees in sanitary engineering veterinary science and even pharmacy. Upon this analysis is based a plea for basic qualification specialist training post-graduate courses and full-time service for those well qualified.

Clothing Industry.—A survey of the hazards to health common to factories in general showing that the danger of carbon monoxide poisoning from gas-fired hardening etc.) is highest in the clothing industry. Hygiene service over a period of five years (1932–7) has reduced this hazard from 7 per cent. to 2 per cent. Similar reductions in other risks and dangers except that of glare from artificial lighting have been effected.

Smoky Atmosphere and Pneumonia.—Pittsburgh has a comparatively high pneumonia rate and an atmosphere laden with

dust and smoke As a result of 3 000 necropsies nothing tangible was found to connect pigment deposition in the lungs with the high incidence and high mortality of pneumonia The association of severe anthracosis and healing by organization was verified

Causes of Stillbirth—In the U S A 77 000 stillbirths are registered annually Products of conception previous to the fifth month are not registered as stillbirths in most States In addition there are 63 000 infant deaths of which 89 per cent occur in the first month and are largely due to natal and prenatal causes A plea for uniform reporting a standard certificate post mortem examinations an acceptable method of classification, and co operation between physicians is made

Annales de Dermatologie et de Syphiligraphie

Paris vol 9 April 1938

Syphilis causing Rupture of Viscera Spontaneous Rupture of Gummatous Kidney—M Favre P Croizat and R Martine
*Subacute Cutaneous Lymphogranulomatosis—S Nicolau

Subacute Cutaneous Lymphogranulomatosis—Nicolau points out that lymphogranuloma inguinale is rarely a skin disease and in fact only seven cases of subacute cutaneous lymphogranulomatosis could be found in the literature He himself describes fully a case (with photographs) with involvement of a large area of skin over the left lower part of the abdomen left inguinal region and the upper part of the left thigh The first signs of inguinal bubo occurred in February but the skin did not begin to show infiltration till the following September In the case described the affection did not spread along the lymphatic channels but seemed to traverse the reticular tissue, and in this respect presented an analogy with those cases in which lymphogranuloma inguinale causes long fistulous tracks in the depths of the subcutaneous tissue

Annales d Hygiene Publique, Industrielle et Sociale

Paris vol 16 April 1938

*Report on Apparatus for Tendering Meat—Albert Besson

*Two Epidemics of Diphtheria at a Berujeu Preventorium at an Interval of Five Years—Marcel Brongniart
Training of Hygienists and Medico social Control of Public Assistance—A Dupuy

Tendering Meat—It is customary among French butchers to use an instrument furnished with numerous small thin steel blades for beating meat so that the tough fibres are cut thereby producing tenderness It is submitted that meat thus tendered is sold by misrepresentation, and that such an instrument may readily convey infection The use of these instruments has been prohibited in the Somme district and a plea is entered for extension of the prohibition throughout the country

Two Diphtheria Epidemics—The Preventorium is a country convalescent home for delicate (city) children In spite of preliminary examination of the throats of entrants, outbreaks of diphtheria occurred in 1931 and 1937 The results of bacterial and other investigations the effect of immunization with Ramon's anatoxine the part played by carriers and suggestions for preventive measures of a practical nature are discussed in detail

Annals of Internal Medicine

Baltimore vol 11 April 1938

Large Pericardial Effusion complicating Acute Coronary Thrombosis—E S Nichol
Hyperinsulinism Associated with Hyperthyroidism Two Cases—J L Carmichael
Musculospiral Paralysis after Serum Injection (Recurring after Second Injection)—L Brahdy

Cobra Venom—The claims of French workers that cobra venom has a valuable analgesic action are confirmed and extended In the doses employed cobra venom is no more toxic than many widely used alkaloids In comparison with morphine its action is of slower onset but much more enduring, lasting for one or more days It is of especial use in cases of intractable pain due to inoperable cancer It is also claimed that the venom is useful in relieving the pain and rigidity of Parkinson's disease

Upper Lobe Pneumonia—Upper lobe pneumonia was found in 24 per cent of a series of 180 cases of lobar pneumonia and the mortality rate was 42 per cent The condition is remarkable for the infrequency of physical signs of consolidation and the simulation of pulmonary tuberculosis the marked toxicity and the frequent occurrence of meningitic symptoms, and the infrequency with which pneumococci of a definite type could be isolated Excellent radiographs of typical cases are given

Liver and Biliary Tract Review for 1937—C H Greene M Plotz and S A Locallo

Laurence-Moon Biedl Syndrome—Two cases of this syndrome are reported and the present knowledge of the condition is reviewed and its association with retinitis pigmentosa discussed The view is put forward that the syndrome is a congenital anomaly dependent on an inherited chromosomal factor

Complement Fixation in Amoebiasis—The results of this test and of clinical examination with microscopical inspection of the stools were compared on a series of cases of amoebic dysentery and of diarrhoea due to other conditions It is concluded that in the individual case microscopical examination of the stools is still the most reliable diagnostic method

Prolonged Meningococcal Septicaemia—Three cases are reported and the American literature on this condition is reviewed Fever of tertian or quartan type of prolonged duration associated with myalgia multiform erythematous rashes and the absence of cachexia are significant features Meningococcal endocarditis is distinguished by a high and sustained temperature

Experimental Encephalitis produced by Intravenous Injection of Various Coagulants—P F A Hoefer T J Putnam and M G Gra

Peri arteritis Nodosa—In this paper after a general discussion of the disease Kernohan and Woltman give a detailed clinical and pathological discussion of five cases of peri arteritis nodosa with neurological symptoms They conclude that the degeneration of the peripheral nerves appears to be the result of the occlusion or marked narrowing of the lumen of the nutrient arteries and is not due to inflammation in the nerve or to the effects of the toxins of the disease

Experimental Encephalitis—Hoefer and his co workers have produced in animals neurological symptoms and pathological changes in the nervous system by means of sublethal doses of coagulants given intravenously In the successful experiments such symptoms as blindness and paralysis of the limbs were produced and an intense degenerative reparative and exudative process involving both the grey and white matter was found in the cerebral hemispheres These changes were most intense round the venules and it is stated that the lesions closely resemble those of post vaccinal and post measles encephalitis

Radiotherapy of Benign Bone Tumours—The major part of this paper is devoted to a description of the technique and results of radiotherapy in giant cell tumours of bone The statistics show a high proportion of cures with the method recommended A benign giant cell tumour may degenerate into osteogenetic sarcoma in some cases the degeneration can be traced to injury It is possible that frequently repeated small doses of x rays may have a stimulating effect on the growth It would therefore seem advisable to use less frequent larger doses at longer intervals The authors are against the combination of surgery and x rays for giant cell tumours as this may possibly favour malignant degeneration The paper includes also a short discussion on bone cysts with special reference to x-ray therapy In the case reported malignant degeneration occurred after eighteen months in spite of extensive calcification of the original tumour under the influence of radiotherapy Benign chondromata are also discussed these tumours are seen to be radio resistant and large doses of x rays are required to destroy them

*Scope and Indications for Positive Pressure Pathological and Physiological Foundations—Killian
Present Position of Gas Anaesthesia II Ethylene—B Wilde

Positive Pressure Anaesthesia—The conditions present in open and closed pneumothorax and their effects on the difficulties and dangers of chest operations are fully discussed The mobility of the mediastinum is the most important factor and means for estimating this before operation are outlined The effects of the analeptics coramine cardiazol, etc on the respiratory system are shown to consist of a general increase in muscle tone with consequent enlargement of available lung area as well as central alterations of the rate and depth of breathing Recent work has shown the Breuer Hering reflexes to be similarly concerned with alterations in muscular tone rather than with automatic working of the respiratory cycle The starting position of the muscles of respiration is thus modified in order to correlate the available lung area with the oxygen needs of the body

Transactions of the Royal Society of Tropical Medicine and Hygiene

London vol 31 April 20 1938

*Climatic Bubo or Lymphogranuloma Inguinale—H M Hinschell
*Climatic Bubo or Lymphogranuloma Inguinale in African Natives—Clement C Chesterman

Some Cases of Disseminated Sclerosis—N A Dyce Sharp
Schistosomiasis in Kavirondo District of Kenya Colony—R M Dowdeswell
Amoebic Hepatic Abscess and Associated Pericarditis—F M Purcell

Climatic Bubo—During the last twenty years out of 17 900 male cases of genito inguinal lesions 130 cases of climatic bubo have been diagnosed only in four was the primary lesion present An account is given of the general and special diagnostic points If response to protein shock therapy is not obvious within a fortnight excision of the affected glands should be considered operation may be necessary in 15 per cent of cases

In African native women the primary lesion is an ulcer on the labia or vestibule Subsequent evolution occurs by chronic ulceration with induration and but little epithelialization producing perforations adhesions, or stricture Inguinal adenopathy is rare and rectal stricture and various fistulae are commonly associated with the vulval lesions

Twenty six strains of virus have been isolated by intracerebral injection into mice The small cytoplasmic granules found in the inguinal lesion of man in the brains of infected mice and monkeys and in experimental buboes in guinea pigs almost certainly represent the aetiological agent Similar granules are found in the chorio allantoic membrane of the developing chick embryo infected with lymphogranuloma inguinale in the cells of the rabbit's cornea grown in tissue culture and in Tyrode tissue cultures of the virus The dimensions of the virus as shown by filtration through graded collodion membranes appear to be about 0·125 μ to 0·175 μ but larger forms occur and it is possible that the virus may undergo a cycle comparable to that of the psittacosis virus An antiserum prepared by injection of material from which the elementary corpuscles have been removed by differential centrifugation contains no virucidal immune bodies on the other hand an antiserum prepared by the injection of concentrated suspensions of elementary bodies relatively free from tissue elements contains virucidal immune bodies It thus appears that the presence of elementary bodies is essential for the production of virucidal immune bodies

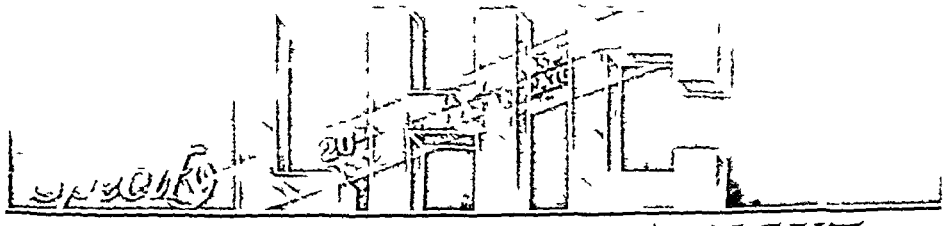
Improved Inoculation Method for Cancer Research—St Konsuloff
Clinical Consideration of Occupational Cancer of Asbestos Workers—F Hornig
*Occupational Cancer of Asbestos Workers—M Nordmann

Multiple Tumours—In a series of 4 000 necropsies 55 per cent were cases of tumour formation and in 40 per cent of these there were multiple tumours The frequency of multiple tumours was greater in women than in men and increased with age Multiple tumours were more often benign than malignant and there was evidence of a connexion between benign tumours and malformations The theoretical implications of the results are discussed

Lung Cancer in Asbestos Workers—Nordmann reviews the previously recorded cases of lung cancer associated with asbestosis adds two new cases (the clinical features of one of them are described in detail in the paper by Hornig) and discusses the connexion between asbestos and the cancers



TRADITIONAL LONDON

THE OLD COLLEGE OF PHYSICIANS
WARWICK LANE

The College was founded by Linacre, Henry VIII's physician and incorporated in 1518 and until 1560 the College met in his house. From that date it migrated to Amen Corner and eventually occupied the fine quadrangular building shown above designed by Wren in Warwick Lane, until 1825. Wren's building was pulled down in 1866

London Hospital Catgut has no less finer traditions behind its development to a leading place in the esteem of Surgeons the world over. It is a product of scientific research, made throughout at the London Hospital under licence of the Ministry of Health.

LONDON HOSPITAL CATGUT

OBTAINABLE FROM ALL LEADING SURGICAL EQUIPMENT HOUSES

MILTON AS A DOUCHE

Patients often ask for advice on a suitable antiseptic In the many cases where a douche is indicated, Milton is particularly suitable

1 It is alkaline with a pH of about 10, due to sodium carbonate and not to caustic soda On dilution it forms a mildly alkaline solution which corrects any acidity, but does not harm mucous membranes

2 Even at considerable dilutions, it is still a hypertonic solution

3 It is miscible with mucus and pus and dissolves semi-solid proteid matter, thus acting as a cleansing agent

4 As will be readily appreciated from its content of 1 per cent of hypochlorite, it has a powerful germicidal action on any micro-organisms likely to be found in the vagina or uterus For B coli for example, it has a R W Coefficient of 2 12

5 It is a deodorant with immediate action, destroying the organic gases by oxidation

Owing to its reasonable price—Milton is sold by all chemists from 6d per bottle upwards—it can be recommended even when expense is a main consideration

A copy of the Pease Laboratories' Report on Milton, some notes on the value of Milton in Gynaecology, and a generous professional sample bottle of Milton will be sent to any medical practitioner

INDUCTOTHERMY—

To-day's *Most Efficient Method* Of Producing Therapeutic Heat

THE consensus of recent papers on therapeutic heat is that Inductothermy is the method of choice not only because it is more effective clinically but also because it is safe and comfortable for the patient. These prominent physiotherapists prove clearly that Inductothermy (a short wave circuit utilising *electromagnetic* and *electronic*) is more effective because it develops deep heat and functions where it is *most useful*—in the vascular tissues. Because Inductothermy heats tissues selectively according to their conductivity, gentle soothing warmth is induced without the discomfort of other methods, and refined control permits adjusting this deep heat instantly to perfect tolerance. You will find too that Inductothermy relieves pain quickly, giving patients immediate evidence of the kind they understand that you are benefiting them.

The story of Inductothermy is given in an illustrated booklet that is free for the asking: simply write for Pub. AL 2—you will not be obligated.

FOOTWEAR
& NATIONAL FITNESS

MEDICAL men have of course long realised the importance to fitness of properly made and accurately fitted footwear

It has been said that manufacturers and shoe retailers have failed in the past to provide such footwear and that retailers have lacked the necessary knowledge and skill to fit shoes correctly

We would draw attention to the fact that we have long been alive to the importance of this matter and have concentrated for many years upon the production of shoes the correct construction of which meets with the approval of medical men and which can be fitted with great accuracy by properly trained assistants

There are more than 300 retailers who are fully trained and qualified to fit our shoes correctly

Church's Arch Moulded Shoes are made in a wide variety of styles for men and women (there is nothing of the 'surgical' shoe about them) They contain fixed supports for the longitudinal and metatarsal arches, and they are available in a full range of graded fittings which include six different widths in sizes and half sizes—upwards of 100 fittings in all

We will gladly send particulars to anyone interested

ST. ANDREW'S HOSPITAL

FOR MENTAL DISORDERS

NORTHAMPTON

FOR THE UPPER AND MIDDLE CLASSES ONLY

President THE MOST HON THE MARQUESS OF EXETER C.M.G. A.D.C.

Medical Superintendent THOMAS TENNENT M.D. M.R.C.P. D.P.H. D.P.M.

This Registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients who are suffering from incipient mental disorders or wish to prevent *recurrent attacks of mental* trouble, temporary patients and certified patients of both sexes are received for treatment. Careful clinical, biochemical, bacteriological and pathological examinations. Private rooms with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE

This is a Reception Hospital in detached grounds with a separate entrance to which patients can be admitted. It is equipped *with all the apparatus* for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical bath, *Plombières* treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray room, an Ultra-Violet Apparatus and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological and pathological research.

MOULTON PARK

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit and vegetables are supplied to the Hospital from the farm, gardens and orchards of Moulton Park. Occupation Therapy is a feature of this branch and patients are given every facility for occupying themselves in farming, gardening and fruit growing.

BRYN-Y-NEUADD HALL

The seaside house of St. Andrew's Hospital is beautifully situated in a park of 330 acres, Llanfairfechan, amidst the finest scenery in North Wales. On the North West side of the Estate a mile of sea coast forms the boundary. Patients may visit this Branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses and bowling greens. Ladies and gentlemen have their own gardens, and facilities are provided for handicrafts such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 2356 and 2357 Northampton), who can be seen in London by appointment.

THE COPPICE, NOTTINGHAM

HOSPITAL FOR MENTAL DISEASES

This Institution is exclusively for the reception of a limited number of Private Patients of both sexes of the Upper and Middle Classes at moderate rates of payment. INCORPORATING THE ROSS INSTITUTE

POSTS OVERSEAS FOR MEDICAL MEN

A register is kept in the School of medical men who are prepared to be considered for posts overseas and the School is frequently asked to advise plantation and mining companies when such posts fall vacant.

The salaries offered are attractive conditions of service are governed by standardised forms of contract and many of the posts offer to medical men a most interesting field in which to practise their profession

It is desirable that candidates for posts overseas should hold a diploma in tropical medicine and hygiene The course provided by the London School for the Conjoint Board's Diploma lasts six months and the tuition fee is £40 The course may be taken from October to March or from January to June. There are generally more vacancies in the course commencing in January

The Director of the Ross Institute is always glad to interview medical men who would like information regarding the possibilities of a career overseas if they will be good enough to make an appointment to call on him Enquiries may be addressed to

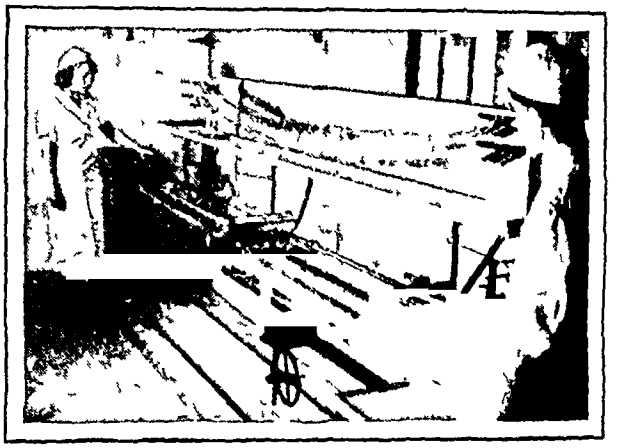
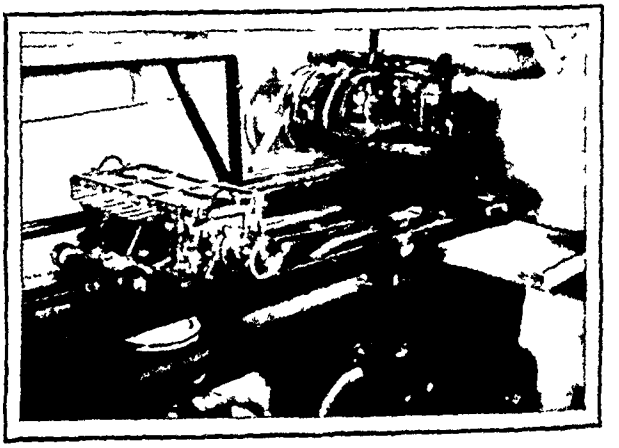
THE IMPORTANCE OF PRECISION POLISHING



In order to obtain uniformity of calibre and complete roundness of strand along its entire length, A & H Catgut is polished by automatic machinery

Hand polishing of individual strands fails to obtain this desirable precision and uniformity in the production of surgical catgut strands



One of the modern advantages incorporated in the production of A & H Catgut.

The entire product manufactured in England

A descriptive booklet will be sent on application

Precision Automatic Polishing, in one operation, of twelve catgut strands, each 10 feet in length

TRADE MARK **'TABLOID'** REG. U.S. PAT. OFF.

SULPHONAMIDE-P

0·5 gramme

(SULPHANILAMIDE)

The successful bactericide for oral use in hæmolytic streptococcal infections. Its valuable action is due largely to the rapidity with which the drug is diffused throughout the tissues and fluids of the body.

Effects are marked in puerperal septicæmia, meningococcal and urinary tract (*B. coli*) infections. May be used also in gonococcal and certain other infections.

Development of
HEARING AIDS

We, Multitone Electric Co, Ltd, do not believe ourselves to be the largest Deaf Aid manufacturers in this country We do believe, however, that we lead, and have led for several years, the development work of the Valve Amplifier Hearing Aid As *invariably happens in a new field* such is this numerous other manufacturers have from time to time endeavoured to copy our inventions, and the following list of some of our principal developments and patents will show the improvements which we have ourselves introduced, and may clear up misunderstanding

1932 **TONE CONTROL**

Developed and patented the TONE CONTROL TRANSFORMER The only practicable tone control then available for Deaf Aids Used at the time by practically all Deaf Aid manufacturers under licence BRITISH PATENT No 381,540

1933 **CLASS INSTALLATIONS FOR DEAF SCHOOLS AND RADIO FOR THE DEAF**

Developed and patented the DEAF AID RADIO SET, which provided deaf people with radio programmes as well as speech amplification This was supplied to a large number of Deaf Schools all over the world, including all the London County Council special schools BRITISH PATENT No 416,436

1934 **UNMASKED HEARING**

Developed and patented a system of overcoming the masking of high notes by low and middle notes in Deaf Aid amplifiers by employing a pair of telephones in one of which the intensity of low and middle notes is greatly reduced Thus, since the lower and middle notes heard in one ear cannot mask the high notes heard in the other a high order of intelligibility is obtained even at very high volume levels The same effect cannot be obtained by using only one telephone This system, which is protected by British Letters Patent No 434,294, has since 1934 been described by us and has come to be generally known by the Medical Profession and deaf people as UNMASKED HEARING

CRYSTAL MICROPHONE IN PORTABLE DEAF AIDS

We believe that our Portable Type P, first shown at the Radio Exhibition 1934, was the first commercial Deaf Aid to employ a crystal microphone

1935 **POCKET VALVE DEAF AID**

Introduced what we believe to be the first POCKET VALVE AID offered to the deaf

1936 **THE REACTOR DEAF AID**

Produced miniature 3-valve crystal microphone Deaf Aid Entirely dry battery operated and employing negative reaction for tone and volume control BRITISH PATENT No 476,877

AUTOMATIC VOLUME CONTROL

Introduced Automatic Volume Control in Deaf Aids

1937 **THE VEST POCKET MULTITONE**

Produced a 3-Valve Crystal microphone Deaf Aid for the pocket believed to be the first of its type

TELESONIC SYSTEM FOR THEATRES AND CINEMAS

Developed a form of inductive pick-up for theatres and cinemas which we gave the name of TELESONIC SYSTEM According to this system the Deaf Aid receives the recorded sound in the case of cinemas or the sounds on the stage in the case of theatres not through the microphone but through a pick-up coil which is energized by conductors disposed about the auditorium Thus the deaf person can hear from any seat in any part of the house without attaching the instrument to any fixed point and without being disturbed by the usual auditorium noises Some cinemas and theatres have already been fitted up by us and the system is being taken up by the Gaumont group of cinemas Negotiations with other groups are in progress Patent has been applied for
Since our first installation numerous attempts have been made to devise or market similar systems with which we are in no way concerned

1938 Developments during the current year will be dealt with in our next advertisement

PURE enjoyment with this filter tip

In du Maurier cigarettes the full flavour of Virginia tobacco can be enjoyed in the certainty that no throat irritants, no "bits" of tobacco, nothing in fact but the pure and fragrant smoke can pass through the filter tip. The five protective layers in the filter tip are there to guard the health of smokers. du Maurier can be bought either cork tipped in the red box or plain tipped in the blue box.

du MAURIER

the perfect cigarette with the exclusive filter tip

OXYGEN AND NITROUS OXIDE

an important announcement

MEDICAL · BOC · SECTION

to physicians, anaesthetists and hospital authorities . . . .

OWING to the increasing demand for its Medical Gas Products, especially Oxygen and Nitrous Oxide, THE BRITISH OXYGEN COMPANY LTD has established a Medical Section which will control the distribution of Gases and Apparatus and the installation of Pipe Line Equipment throughout the United Kingdom

PRICES According to the consumption of the user and the size of cylinders prices have been established which are uniform throughout the country These prices in nearly all cases represent a considerable saving to Hospitals They are the same whether the Company's or privately owned cylinders are used Further saving can be effected by the use of larger cylinders Gases will be sold by "the cylinder" and not by the cubic foot

CYLINDERS Sizes are being standardised—the smaller and odd capacity cylinders are being withdrawn and Large numbers of new 20 40 100 and 150 cu ft cylinders are being put into circulation All are being treated in enamel finish and fitted with new easy working Chromium Plated Valves The larger sizes for Oxygen Tent and Pipe Line use are fitted with self supporting ring bases

NO HIRE CHARGES In future no Hire Charges will be made on Medical Gas Cylinder Many thousands of new cylinders are needed to make this important innovation possible and the co operation of customers is requested in the matter of the speedy return of empties

DELIVERY SERVICE Our fleet of vans has been considerably augmented so that almost every town in the Kingdom is covered by a Regular Guaranteed Delivery All gases are Delivered Free moreover intermediate requirements by Rail or Carrier are also (subject to certain conditions) delivered free Hospitals which already deal direct with the Company will receive automatically the benefits of the new conditions as from 1st July 1938 Others are invited to write for particulars

Allow the Medical Section to supply all your gas requirements—

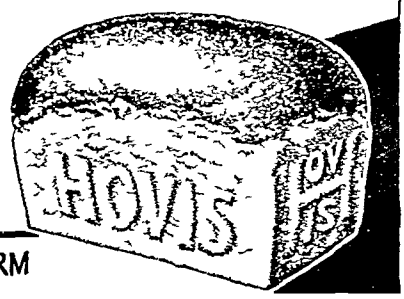
Expectant and Nursing Mothers thrive upon Lactagol

Sinusitis in Older Children

ARGYROL
BRAND SILVER VITELLIN

Infections in older children with larger sinuses and relatively smaller ostia require special treat ment in addition to the removal of constitutional disorders



The most approved treatment consists of the use of suction, removal of adenoids, and nasal tam pons of 10 per cent solution of Argyrol—the standard in mucous membrane inflammations for many years

Argyrol has peculiarly sedative, inflammation-allaying qualities, and its clinical successes of 30 years' duration may be easily accounted for by pertinent chemical facts

The very great differences between Argyrol and other silver salts in silver ion and in hydrogen ion concentration (or alkalinity) no doubt have much to do with the irritation noted by doctors when allegedly equivalent mild silver proteins are substituted The pH and p Ag of Argyrol are especially regulated for treatment of delicate mucous membranes Insure the results you expect—specify 'ARGYROL"

IT ISN'T JUST "GOOD-FOR-YOU"

DOLE Pineapple Juice as you can see from the analysis below is a valuable addition to anybody's diet It is a good source of Vitamins A B and C and natural fruit sugars It provides mineral salts Calcium Oxide 022% Magnesium Oxide 019% Copper 0002% Manganese 0003% and Iron 0005% Dole Pineapple Juice has an alkaline reaction in the body which tends to offset the effects of acid producing foods It has been accepted by the American Medical Association Committee on foods and is in constant use in many American Hospitals and Nursing Homes

But it is equally important that this valuable fresh fruit drink is more than acceptable to patients especially children with obstinate appetites or fickle tastes Its fresh fine flavour, not like the syrupy liquid you expect to find with tinned pineapple is refreshing thirst quenching and invigorating *It is not often you come across a drink that you can recommend with such sure knowledge that your advice will be followed*

TYPICAL ANALYSIS OF DOLE PINEAPPLE JUICE

Moisture	85 3 %	Titratable acidity as citric acid	0 9 %
Ash	0 4 %	Reducing sugars as invert sugar	12 1 %
Fat (ether extract)	0 3 %	Carbohydrate other than sugars (by difference)	0 38 %
Protein (N 6 25)	0 3 %		
Crude fibre	0 02%

A NEW TECHNIQUE FOR THE INFUSION OF BLOOD AND SALINE

The infusing of citrated blood and saline by means of the new Baxter Indirect Blood Transfusion Apparatus, coupled with a Baxter "Vacoliter" of Saline Solution, is the latest contribution on the part of Baxter to Intravenous Therapy

Over 400 Hospitals in England have standardised on Baxter's Intravenous Solutions in "Vacoliters" and we are glad to present this further evidence of the efforts of the Baxter Laboratories to improve and simplify Hospital methods

We shall be pleased to send on request further details regarding the Baxter Blood and Saline Infusion Technique and welcome the opportunity to show you how simply and effectively it operates

THYMINIC ACID BASE

URALYSOL

TRADE MARK

FORMULA

Thyminic Acid	0 10
Hexamethylenetetramine Anhydromethylenecitrate	0 50
Hexamethylene Tetramine	2 50
Piperazine Tartrate	0 25
Lithium Carbonate	1 00
Sodium Benzoate	1 00
Effervescent Base	ad 100

DIRECTIONS

One teaspoonful to be taken morning and night in a tumblerful of water

Uralysol, in addition to being a solvent and eliminator of pathological Uric Acid, is a powerful urinary antiseptic.

Normally there exists in the body a certain quantity of uric acid which assists general metabolism, and after it has played its part is eliminated together with the normal thyminic acid of the organism When however, uric acid is present in excess, the body needs additional thyminic acid to supplement the resultant deficit of this normal solvent of uric acid

Uralysol, by its thyminic acid content, supplies the agent necessary to dissolve excessive uric acid

The next step is the elimination of this thyminic uric acid which, being in excess of normal, necessitates treatment by an agent capable of enhancing elimination

Uralysol, by its content of hexamethylenetetramine and lysidin, stimulates the organism to eliminate the pathological uric acid already dissolved by its thyminic acid content.

PROTAMINE INSULIN

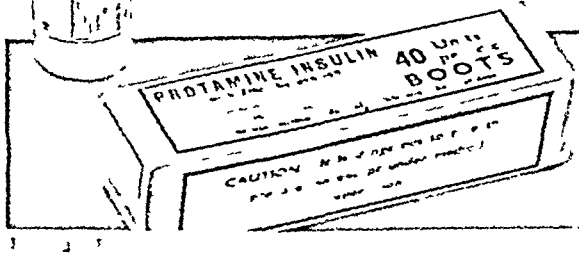
(with Zinc) SUSPENSION .. BOOTS

The fall in blood sugar after injection of Protamine Insulin (with Zinc) Suspension is gradual, and the Insulin carbohydrate metabolism reproduces closely the continuous secretion of Insulin as it takes place in the normal person

RELATIVE HYPOGLYCAEMIC EFFECT OF
PROTAMINE INSULIN
(WITH ZINC) SUSPENSION BOOTS and INSULIN

Blood sugar curves from a man aged 65 years; the first while taking Insulin, the second while taking Protamine Insulin (with Zinc) Suspension—Boots. The diet was the same on both occasions. (See Brit. Med. J. 1937, 1, 516).

With small doses (under 30 units) the risk of hypoglycemia is less than with Insulin and Protamine Insulin (with Zinc) Suspension is particularly valuable for use in general practice Supplied in rubber capped vials in the following strengths



40 units per c.c.

5 c.c. vial (200 units) - - 2/1
10 c.c. vial (400 units) - - 1/6

80 units per c.c.

5 c.c. vial (100 units) - - 1/6

Full details of the treatment of Diabetes Mellitus with Protamine Insulin (with Zinc) Suspension are given in our booklet a copy of which will be sent on request to the

MERSALYL B.D.H.

Injection of Mersalyl B P

The use of mercurial diuretics has become an established routine in ordinary clinical practice The superiority of the sodium salt of salicyl-(γ-hydroxymercuric-β-methoxypropyl) amide-O-acetic acid over other diuretics is officially recognised, and this substance has been included in the B P Addendum under the name 'Mersalyl' and as 'Injection of Mersalyl'

Mersalyl is indicated in various œdematous conditions, particularly those associated with cardiac dysfunction

It will be found in most cases that premedication with digitalis considerably enhances the effect of mersalyl

Mersalyl B D H is available in a sterile buffered solution in ampoules of 1 c c and 2 c c , it is supplied also in suppositories for adjuvant treatment or for administration (following a single injection) in mild cases

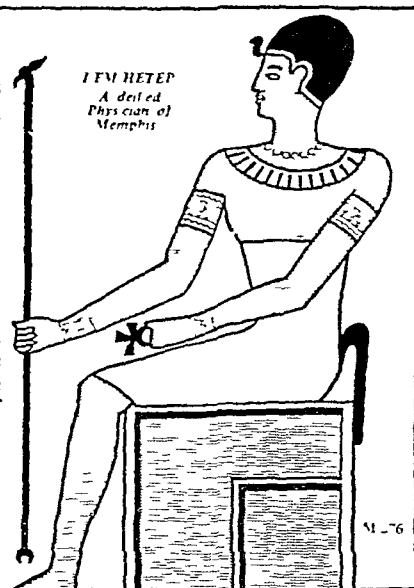
OVALTINE

IN PREGNANCY



THE physiological drain of calcium phosphorus vitamins and other important food elements calls for replacement during pregnancy Composed of milk eggs and malt 'Ovaltine' supplies these essentials in a delightful form which does not overtax the unstable maternal digestion A cup of 'Ovaltine' on arising during the early months, is often effective in controlling sickness and has a food value greater than three eggs

IN LACTATION

To maintain lactation to the eighth month is an ideal not often realized under modern conditions of life Ample evidence is available to show that 'Ovaltine' has a definite action in increasing the flow and enriching the quality of the milk It has, moreover a beneficial effect on the health of mother and child The flavour is so agreeable that it can be taken for prolonged periods without any distaste arising

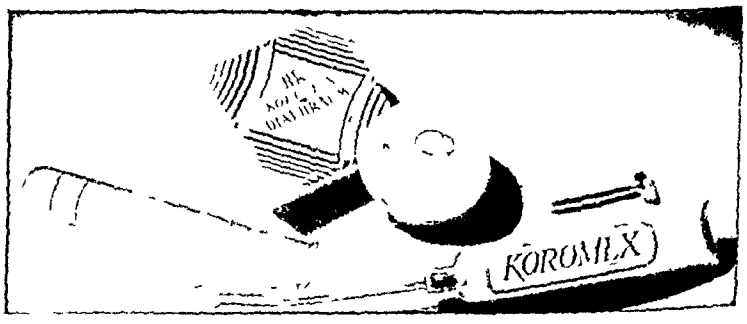
KOROMEX METHOD

The Koromex Occlusive Diaphragm is made in a range of sizes to fit each individual patient, pure latex rubber pessaries Light and comfortable, practically unfelt Two-year durability guaranteed Practitioners and birth control clinics, for more certain protection, prefer to use the perfect fitting Koromex Diaphragm with

KOROMEX VAGINAL JELLY



Stainless and prolonged effective spermicide The carefully gauged viscosity of Koromex Jelly affords the all-important mechanical block No toxicity or irritation makes the diaphragms easier to insert

Advise the Koromex Method Your patient will be grateful

A sample of Koromex Jelly will be sent on application to medical practitioners also a booklet the Physician's Guide on the technique of fitting the Occlusive Koromex Diaphragm No charge Write to

The Highest Record of PROVEN SUCCESS in Contraceptives

● **Evidence of the high degree of efficacy of the Koromex Method is based upon the experience of 234 clinics—140 hospitals—over 50,000 physicians.**

THE KOROMEX METHOD

KOROMEX DIAPHRAGM + KOROMEX JELLY

● The Koromex Diaphragm appears on the National Birth Control Association's approved list with seven Premier products, including Condoms, Sheaths, Jellies and Suppositories Price list and samples on request

PRENTIF LIMITED, CONTRACEPTIVE SPECIALISTS, LONG'S COURT, ST. MARTIN'S STREET, LONDON, W.C.2

Sole agents in Great Britain for Holland-Rantos Co., Inc New York

If you are not receiving regularly the Prentif Quarterly Medical Bulletin Contraception Practice Kindly inform us We shall be pleased to supply missing back numbers and arrange that future issues are specially sent

CRUNCHY FOODS AND THE HEALTH OF CHILDREN

The inclusion in every child's diet of a quantity of hard, dry food is regarded as essential by many practitioners Such food compels thorough mastication, the regular exercise this gives to the jaws is believed to assist their correct development, thus preventing many possible troubles to the teeth in later life

The importance of instilling the habit of thorough mastication is further stressed because of its value to digestion, to which the practice of swallowing insufficiently chewed masses of food is considered extremely harmful

Many physicians therefore recommend that growing children should eat crisp Ryvita with their meals Free samples of Ryvita for distribution to patients will gladly be supplied on request

INDICATIONS FOR SANATOGEN No 5

"NERVES"

"Social conditions not a direct determinant"

found Guy's Hospital

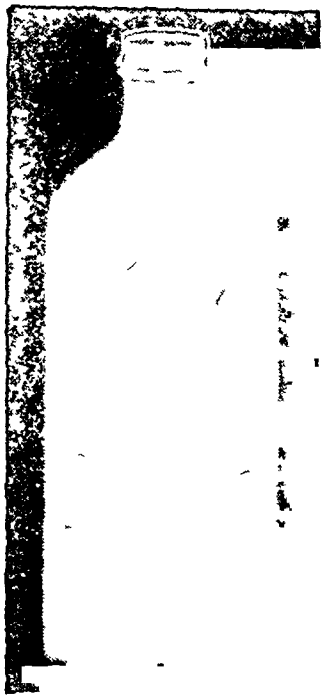
The recent investigations conducted by the Department of Psychological Medicine of Guy's Hospital show that poor social conditions are not in themselves a direct determinant of nervousness in young people Yet impaired alimentary absorption combined with increased bodily demand for certain food elements is characteristic of sufferers from neurasthenia and other forms of "nervous debility"

In the treatment of functional nervous disorders, occupational therapy, change of surroundings, suggestion, psycho-analysis, and other methods essentially psychic, play a leading part But the nutritional problems also call for consideration The "nervous" patient, whether adult or child, usually has poor capacity for absorbing and metabolising the food he eats, and he is quickly fatigued

Hence it is that marked improvement in these cases nearly always follows the regular use of 'Sanatogen'—a carbohydrate-free product of 95 per cent pure milk casein, with 5 per cent sodium glycerophosphate 'Sanatogen' is easily digested and quickly absorbed Also it promotes the absorption, and increases the nutritive value, of other foods It helps to restore mental and nervous energy, lessens depression and postpones the onset of fatigue

'SANATOGEN'

A brand of Casein and Sodium Glycerophosphate



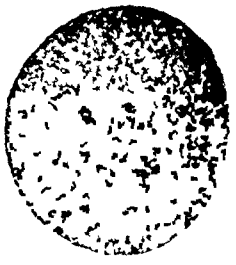
Sold by all chemists price 2/3 to 19/9

DOSAGE For children and adults two teaspoonsful three times daily or according to circumstances For infants teaspoonful added to each bottle feed

GENATOSAN LTD LOUGHBOROUGH

Clinical samples and literature available on request to

GENATOSAN LTD, LOUGHBOROUGH, LEICESTERSHIRE.



X-ray reveals uniform density of Agarol

. . . Agarol has had a physical examination

THE x-ray says "Look for uniform density throughout as evidence of soundness" Agarol brand Compound *is* a thoroughly uniform emulsion that acts the same way with every dose

The microscope says "Look for the small uniform oil globules" as a sign of thorough *emulsification of Agarol* It means stability, freedom from oiliness, ready miscibility with water, milk, fruit juices or any other liquid

The microscope shows extremely fine division of oil in Agarol

The pharmacist says "If it pours freely, it is the sign of a good emulsion" Agarol is a good mineral oil emulsion that has thoroughly proved its value in the relief of acute constipation and in the treatment of habitual constipation

Descriptive literature and a liberal supply of Agarol supplied gratis to Members of the Medical Profession on request

Agarol is not advertised to the public

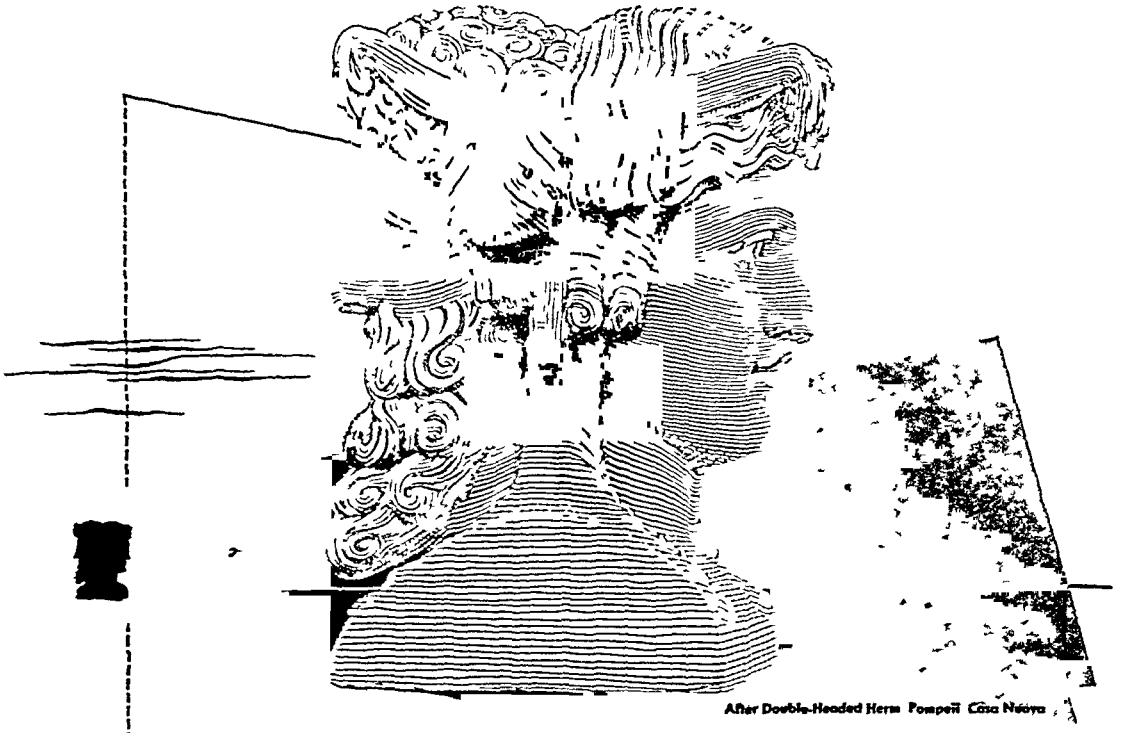
Crookes'

LACTOMAGNESIA

SPECIMENS WILL GLADLY BE SENT TO MEMBERS OF THE MEDICAL PROFESSION UPON REQUEST

4 ozs	1/
8 ozs	1/9
For dispensing 80 ozs	15/



CROOKES Lacto Magnesia contains 43 grains (10 per cent) magnesium hydroxide in each fluid ounce

It presents the hydroxide in an extremely fine state of sub division – colloidal form – ensuring an even and rapid effect This is of great value when the product is used as a mouth wash and penetration to the innermost folds of mucous surfaces and to the interstices of the teeth is desired

In dental practice and when an alkaline mouth wash is called for two teaspoonfuls stirred up in a half to one wineglassful of water is effective and refreshing

CROOKES Lacto Magnesia has a pleasant natural flavour and is most economical both in price and in usage

PARKE-DAVIS RESEARCH LABORATORIES, DETROIT.

RESEARCH LABORATORIES

In a building which stands apart from the main manufacturing plant the Parke-Davis Research Laboratories house a staff of scientific workers engaged in the search for new medical knowledge and in the elucidation of problems connected with the treatment of disease.

Each of the separate phases of research work, such as bacteriology, botany, chemistry, pharmacology, physiology, pharmacy, etc., is supervised by a scientist of specialised training and frequently of national or international reputation. Under him is a staff of skilled technicians working with up-to-date equipment in an endeavour to bring to light new knowledge and to explore new avenues in the conquest of disease.

This work of research which has been in progress in the Parke Davis Laboratories for more than half a century, is not controlled by time schedule or calendar—often many months and even years are spent in the solution of a problem and the only stipulation is that the work shall be done conscientiously and well.

THE CEREBRAL INTEGRATION OF THE OCULAR MOVEMENTS*

BY

GORDON HOLMES, M.D., I.R.C.P., F.R.S.

Physician to Charing Cross Hospital and to the National Hospital for Nervous Diseases, Queen Square

It is customary among us to commemorate great men from time to time by a lecture or discourse relating to their work or to some subject in which they were interested. To-day we meet to pay a tribute to the memory of Victor Horsley almost on the twenty-second anniversary of his death in the service of his country while striving for those ideals which characterized his life—the relief of suffering and the defence of liberty.

Horsley's name is indelibly inscribed on the records of human achievement. His work as a physiologist is incorporated in the heritage of our knowledge and he will ever be remembered as a pioneer in the surgery of the nervous system which since his day has grown as only his faith could have foreseen. But great though his achievements were in the realm of science it is his personality which keeps his memory most vividly alive to those of us who had the privilege and good fortune to work with him. We recall his amazing energy, his enthusiasm for knowledge, the help he gave so liberally to younger colleagues, his kindness and generosity, and his unswerving devotion to the welfare of his fellows. I accept gratefully this opportunity to add my contribution to his memory.

The subject of this lecture is one to which Horsley's investigations contributed materially; some of his earliest work defined accurately an area of the cortex by stimulation of which ocular movements could be obtained; later he described the anatomical paths connecting the visual cortex with the oculomotor apparatus in the midbrain, and his latest experiments on the cerebellum, which unfortunately have never been published in full, dealt with the movements and postures of the eyes which can be elicited on electrical stimulation of this organ or result from lesions of it.

There are several categories of ocular movements. In the first place we can move our eyes by an act of volition, but few of their ordinary movements are in this sense voluntary or the result of a conscious effort. Any peripheral stimulus as movement a flash of light or a sound may deviate our eyes involuntarily towards its source, while accurate vision demands accommodation and fusion which is effected by so arranging the visual axes that the images of the object at which we look fall on corresponding parts of the two retinae. Finally there are the compensatory or adjusting movements by which the eyes are kept directed on an object when either it or our heads move. The upper part of the brain stem contains a complicated mechanism by which all these types of movement are effected and co-ordinated; here we are not concerned with this mechanism but with the more highly evolved nervous centres at the behest of which it acts.

All our movements, those of our eyes as well as of our limbs and trunk, are directly or indirectly initiated, guided, and controlled by afferent impulses, and in the case of the eyes the most important impulses are those of retinal and labyrinthine origin. The work of Magnus in particular has shown how the labyrinths either alone or in conjunction with proprioceptive impulses from the muscles of the neck ensure the correct postural adjustments of the eyes to changes of the head in space, but in the higher animals retinal impulses suffice for the normal control of the movements and postures of the eyes even where the labyrinths or the fibres conducting from them are destroyed.

Differences in Organization of Vision between Man and Animals

Experiments on animals have contributed much of what we know of the physiology of ocular movements, but all conclusions from such experiments are not applicable to man owing to essential differences in the organization of vision. In the first place each human retina contains an area of highly developed sensitivity at the fovea which is employed exclusively for distinct vision and many of our ocular movements are directed to allow a distinct image of the object which interests us to fall on this part or keep it there. In lower animals which do not possess differentiated foveae such movements are naturally not fully represented. Binocular vision is also more accurately organized in man. Further, though in the phylogenetic scale vision is the first function to acquire cortical representation, the visual cortex is more highly elaborated in the primates and in man complex associational areas which play a part in the movements of the eyes develop around it. The differences in the organization of cortical vision in various animals are obvious from the effects of destruction of the occipital lobes. All observers agree that in man no perception of light or reaction to retinal impulses except contraction of the pupils can be obtained when the occipital lobes are destroyed. In monkeys closure of the lids occurs on sudden illumination (Kluver); dogs can in addition react to differences in intensity of illumination (Marquis); rodents may recognize the position and distance of objects and even avoid obstacles (Lashley); while birds from which the forebrain has been removed may react even more normally to retinal

*The Victor Horsley Memorial Lecture delivered at University College Hospital Medical School on July 12, 1938.

stimuli During ascent in the animal scale there has been, therefore, a gradual transference of vision from lower to higher levels of the nervous system, till in man it is exclusively a function of the cortex

Parallel with this movement of vision corticalwards there is a similar 'encephalization,' or transference towards the forebrain, of the seat of reactions which may be excited by retinal stimuli till in man no movements in response to light are obtainable without participation of the visual cortex It is therefore on the study of clinical material that we must mainly rely in any attempt to understand the physiology of the ocular movements in man But the methods should be the same as those of the experimental physiologist—to study the simpler components of a complicated function by isolating each of them and then attempting to integrate the separate parts into a normally functioning whole We must, however remember that symptoms of dissociation of the ocular movements cannot be simply interpreted as loss of function of the injured part they are usually the response of the organism to the abnormal situation produced by the lesion and include, as Hughlings Jackson repeatedly insisted manifestations of disordered activity of undamaged structures

Cortical Areas Concerned in Eye Movements

In both man and lower animals movements of the eyes can be obtained by stimulation of certain parts of the cerebral cortex One of these which was originally described by Hitzig and Ferrier but was more accurately localized by Beevor and Horsley in the ape lies in the frontal lobe separated by inexcitable cortex from the motor centres of the precentral gyrus Cushing Foerster, Penfield and Boldrey and others have demonstrated it in man The function of this oculogyric centre has naturally been compared to that of the precentral motor area, but Sherrington has shown that in the chimpanzee there are such marked differences in the nature of its responses that it is necessary to put it into a separate physiological category It is interesting that Beevor and Horsley in contrasting the responses from this frontal area in the orang-outang with those they observed in the bonnet monkey, recognized these same features—slowness in development and in execution of the movements of the eyes The projection fibres from this frontal centre pass through the anterior portion of the internal capsule then probably enter the cerebral peduncle and turn dorsalwards into the tegmentum

The fact that destruction of this frontal centre does not produce a persisting palsy of any of the ocular movements has raised doubt on its significance It may be that, as Wernicke suggested all ocular movements are represented in both frontal lobes and consequently as in other bilaterally innervated movements the effects of a one-sided lesion may be compensated by the unaffected side Permanent voluntary palsy in man has however been described by Tilling Lutz and others as a result of bilateral frontal lesions but Ferrier and Turner observed no paralysis after removal of both frontal lobes in the monkey

Ocular movement can be also obtained by electrical stimulation of the visual cortex on the inner aspects of the occipital lobes This oculomotor area was first described by Schäfer and later studied by Munk and others including Foerster in man According to some it is the cortex immediately around the visual area rather than the area striata which is excitable but from our point of view this matters little It was naturally suggested that movements elicited from it are due to subjective visual impressions excited by the stimulus and that these reach the frontal oculomotor centres but Munk showed that they could be still evoked after he had isolated the occipital lobe from the rest of the cortex by a deep incision That there is an apparatus in the occipital lobe from which ocular movements can be excited directly was made more probable by the demonstration by Beevor and Horsley of fibres passing from here to the anterior quadrigeminal bodies in the neighbourhood of the oculomotor nuclei About the same time Probst described these cortico tectal fibres in the cat According to later authors as Minkowski, Bremond, and Poljack they take origin in the cortex around not within, the area striata They descend through the occipital lobe medial to the optic radiations, and pass through the pulvinar and the anterior brachium to reach the tectum of the midbrain

There are therefore two widely separated cortical areas concerned in movements of the eyes and each has its own projection tract to the oculomotor mechanism in the brain stem A study of the effects of their injury or destruction throws light on their functions and on the part each takes in the normal organization of the ocular movements

Effect of Disturbances of Frontal Centres

Disturbances of the functions of the frontal centres produce the more obvious symptoms These usually result from involvement of the frontal projection fibres in the internal capsule or in the neighbourhood of the anterior part of the midbrain rather than of the cortex and in this respect they are comparable to the loss of voluntary power in the muscles of the lips, tongue, palate, and larynx which characterizes pseudo bulbar palsy

The most striking features of a typical case is the inability of the patient to move his eyes to command or when ordered to look at an object in one or possibly in any direction For instance on command to turn his eyes to the right or to look at an object in the right half of the field of vision no deviation of the eyes occurs though the effort at movement is obviously great If the attempt is often accompanied by expressions of distress One patient on being asked to look to the right first turned his head in that direction then jerked it about and raised it from the pillow flexed his body forward and rotated it to the right advanced and flexed his arms clenched his fingers and groaned and protested he could not do it An example of the apparent trophic reaction which Goldstein has described in connexion with failure to carry out a task owing to a cerebral lesion Even when the head is actively turned in the desired direction the eyes often fail to move with it

This condition at first sight shows all the appearance of loss or paralysis of the movement but that this is not present becomes obvious when the subject is asked to follow with his eyes a slowly moving object then if provided the rate of movement is uniform and not too fast a full range of deviation may be obtained If however the displacement of the object he attempts to follow is rapid or irregular the eyes move through only a small angle and quickly slide back to their position of rest When the patient looks at a slowly rotating drum on which lines or figures are displayed the eyes after a time in the direction in which the figures move but the nystagmus seen in normal persons does not appear He may also fail to converge on a near object but can do so when a distant object is slowly approached to him We therefore find that though voluntary effort fails to produce movement the eyes follow a moving object if images of which fall on the fovea

The influence of foveal impulses on the execution of these movements is obvious but impulses from

diate neighbourhood of the macula may be effective too If there are two marks on a sheet of paper the patient may be unable to turn his eyes from one to the other but he can often do so when the marks are joined by a line his eyes then as it were creep along the line from one point to the next the movement being excited by a series of impulses coming from the confines of the foveae Similarly the eyes can travel along a series of closely arranged dots the retinal image of each succeeding dot being an adequate stimulus Attempts to read reveal the same facts the eyes travel slowly from letter to letter but if there is too wide a space between the words the attempt may fail At the end of the line he is unable to bring his eyes leftwards to the beginning of the next line but frequently patients surmount this difficulty by moving a finger slowly along the line as they read and by it lead the eyes back to the start of the next line

Movement of the eyes can be elicited even more easily by either active or passive movement of the head if for instance the subject is unable to look up or to the right his eyes may deviate upwards when his head is bent forwards and to the right when his head is rotated to the left his eyes move simultaneously with his head and through an equal angle but in the opposite direction This compensatory deviation has been by several authors attributed to adjusting reflexes of labyrinthine origin but though this may be their nature in animals under certain experimental conditions we shall later see reasons why it is not the explanation Bielschowsky who originally regarded it as a labyrinthine reaction later stated that this holds only if the movement of the head is quick and abrupt Labyrinthine reflexes may however play a part for in some of these pathological cases a compensatory deviation of the eyes occurs even when the lids are closed and all retinal stimuli thus excluded and in a patient with complete cortical blindness whom I examined the eyes moved to the left when the head was passively rotated to the right and vice versa On the other hand in two patients who were deaf and in whom no vestibular reactions could be excited I found that the eyes moved with the head when the lids were closed as both retinal and vestibular impulses could be excluded the probable explanation is that the tone of the ocular muscles dependent on their own proprioceptive impulses kept the eyes in their normal relations to the orbits

When the eyes are deviated from their normal central position either by following a slowly moving object or by rotation of the head the patient may be unable to move them back or he may experience much difficulty in doing so particularly if the eyes remain fixed on the original point this is one of the arguments against compensatory deviation being essentially of labyrinthine origin for the stimulus which excites the labyrinths is movement and reflexes dependent on them cease rapidly at the end of the movement

Further investigation of these symptoms helps us to understand their nature All observers have been struck by the fact that the paresis is variable under certain conditions no voluntary movement can be observed under others the eyes can move through a modified range at least Though in a typical case deviation of the eyes to either side on command or towards an object is impossible the eyes move simultaneously with his head but in the opposite direction when his head is rotated If however the lids were closed or if the experiment is carried out in a dark room or if a screen is held immediately in front of the eyes so near to them that no point can be accurately fixed this compensatory deviation does not occur There must therefore be a visual factor concerned in the phenomenon and this factor seems to be fixation—that is the tendency to keep the images of the object at which the subject looks on the foveae either by maintaining the postures of the eyes or by moving them

The Fixation Factor

Another series of tests emphasizes even more strongly how important this factor is It in a normal person one ear is irrigated by cold water nystagmus is evoked the slow phase being towards the ear which is irrigated the same effect is obtained by passing a galvanic current through the two ears or by rotating the person In many of these pathological cases however no nystagmus develops but the eyes become strongly and persistently deviated in the direction towards which the slow phase of the nystagmus should occur—that is towards the irrigated ear or towards the anode of the galvanic current This deviation is frequently so strong that it is uncomfortable or distressing to the patient It varies however under different conditions of examination In one patient who lacked almost all voluntary movements of the eyes it was generally very pronounced but on other occasions it could not be elicited Further examination showed that its appearance was influenced mainly by the patient's visual interest in his surroundings for when his eyes were not fixed on an object or when his lids were closed or his eyes screened a strong deviation could always be obtained but when his eyes were fixed on any point as on the eyes of the observer who sat in front of him even the strongest vestibular stimulation often failed to produce any deviation Fixation which was the only variable factor in these experiments is therefore capable of inhibiting the powerful reflex deviations which in its absence can be obtained by stimulation of the labyrinth

Fixation may influence even volitional movements for patients in whom the degree of palsy is not great can often move their eyes on command or look towards an object when accurate fixation is made impossible by placing convex lenses or a screen in front of the eyes In severely affected cases the range of movement possible under these conditions is usually small and the movements which obviously need great effort are jerky and discontinuous but in milder cases an approximately normal degree of deviation may be observed

In attempting to follow a moving object the accuracy of fixation also plays a large part success is possible only when the subject's eyes are accurately directed on the object before it moves and if its movement is so rapid or so irregular that fixation is for a moment broken—that is if its images no longer fall on or in the immediate proximity of the foveae—the eyes cease to follow it and recede towards their position of rest

These observations explain a curious paradox which has often been observed in these patients Though they fail to move their eyes in one or in all directions on command and to turn them towards an object the eyes may at times move about in a more or less normal manner Tiling in the first recorded case of this type found that though there was apparent paralysis of vertical deviations and of movement to the right the eyes sometimes moved involuntarily in these directions in Bristow's case recorded a few years later the eyes moved independently of her will though there was no power of voluntary movement in a similar case Roux reported that nothing in the hospital ward escaped the patient and one of my own cases was regarded by the nursing

attendants as "hysterical," as they observed that his eyes frequently moved about as he lay in bed but failed to do so while being tested. Such spontaneous movements are most often seen when the patient is drowsy or half awake, or when he is in a state of emotional excitement; for instance, one man who was unable to move his eyes voluntarily became excited while being prepared for vestibular tests, and his eyes rolled about in all directions.

It was also repeatedly found that when these patients tried to look towards an object they employed various devices by which to interrupt the fixation of the point on which their eyes were directed: some blinked or closed their eyes momentarily, or jerked their heads abruptly; one man occasionally brought his hands before his eyes. It is therefore obvious that fixation of the eyes on an object tends to impede voluntary ocular movements and can even inhibit the powerful reflex reactions excited by labyrinthine stimuli. It is now necessary to consider the nature of normal fixation.

The Nature of Normal Fixation

Fixation means the maintenance of postures of the eyes by tonic contraction of the ocular muscles so that the retinal images of the object which is fixed fall on the two foveae. These postures can be kept up with remarkable accuracy for long periods. It is true that fixation in this sense is only relative, for the lines of vision constantly oscillate through small angles about the point fixed and consequently the images move over the foveae: this avoids sensory adaptation and the appearance of after-images which would interfere with the acuity of vision. But fixation does not imply only immobility of the globes in relation to the orbits, for we can fix moving objects and keep our eyes on a point when our heads are in motion: this requires constant adjustment of the eyes by contractions and relaxations of their muscles, for the slightest displacement of the head necessitates a compensatory deviation of the eyes in the opposite direction, so accurate and immediate that the foveal images remain relatively stationary. By voluntary effort alone this accurate adjustment of the eyes would certainly not be possible, and the observations referred to above show that fixation may persist when volitional movement is defective. Fixation must therefore be regarded as in part at least a reflex act. But fixation, as all the other visual reflexes, requires perception—that is, the intervention of consciousness—and in this respect the fixation reflex differs from those reactions in which only the lower levels of the nervous system are concerned, to which the term 'reflex' is usually applied.

Normally, fixation is under the control of volition, for we can move our eyes from object to object as we will, but when voluntary movement is defective the fixation reflex becomes so dominant that the eyes may remain anchored to an object and can move from it only when the reflex is broken by interruption of the retinal impulses. It is for this purpose that persons affected with this condition blink, jerk their head, or place a hand between their eyes and the object which fixes gaze. We can speak of the pathological condition as spasmodic fixation. It was first observed and carefully described by Gowers in 1879.

Spasmodic and Reflex Fixation

Spasmodic fixation is comparable to the spastic paresis which results from lesions of the cortico-spinal tracts: in this condition there is, as in the eyes, a defect of voluntary power, but movement is also interfered with by increased tone of the muscles due to uninhibited reflexes initiated by proprioceptive impulses from the muscles themselves; and it disappears when the muscles are deafferented. The exaggerated tone of the ocular muscles on the other hand is dependent on retinal impulses acting on a cortical mechanism no longer under control, when these impulses are interrupted tone decreases, the power of voluntary movement improves, and the responses to other stimuli, either voluntary or labyrinthine, are no longer impeded.

It is impulses of foveal origin which determine reflex fixation. On the other hand, the chief function of the peripheral parts of the retinae is, when an image excites them, to bring about such movements of the eyes that the images fall on the foveae. James has aptly said that the periphery of the retina acts as a sentinel which cries out "Who goes there?" and if necessary calls up the more accurate vision of the foveae. Owing to the increasing sensitivity of the retina as the fovea is approached the tendency of peripheral retinal stimuli to determine fixation is greater the more closely to it the images fall. Even in adult life these fixating movements are largely reflex: a flash of light or a sudden movement in the periphery of our fields of vision attracts our gaze whether we wish it or not. This reflex which determines the fixation of extra-foveal images is the means by which patients suffering from paralysis of voluntary movement can read, follow a line with their eyes, or count a row of dots: each succeeding letter, dot or segment of a line tends to excite a movement, and if the impulse which initiates it comes from near the fovea it may be intense enough to interrupt the strong fixation reflex which tends to impede all the other visual oculomotor reflexes as it does voluntary movement of the eyes.

A special feature of these reflexes is that they imply, in addition to conscious perception, interest and attention. It is only the object which occupies attention that excites the fixation reflex, only the succeeding word or dot which interests the patient that draws his eyes towards it, only the gesture in which he recognizes a threat or danger which makes him blink and turn his eyes away.

Other symptoms which some of these patients present throw further light on the nature of this condition. For instance, one man who also suffered from severe pseudo-bulbar palsy was unable to separate his lips, open his mouth, or perform the movements of chewing on command; but when bread was placed in his mouth he masticated it, he could not protrude his tongue, but when sugar was placed on his lips he licked it. In these respects he was simply a reflex machine. If shown appetising food he merely smiled, but if the food was brought close towards his lips his mouth opened at once and he began to champ his jaws as if chewing; but this occurred only when food in which he was interested was approached to his lips. He therefore possessed another visual reflex, that is, a complicated purposive action independent of volition—which was excited by retinal impression and which entailed not merely perception of an object but also recognition of its nature and of its spatial relations to himself.

The anatomical lesions responsible for the cases characterized by loss or diminution of the power of voluntary movement associated with exaggeration of the fixation reflex may be situated in various parts of the brain. In a few of the recorded cases there were bilateral injuries of the frontal oculomotor centres (Fig. 1), but more commonly the projection fibres from these centres were involved in the internal capsule (Case 1).

it It is an interesting fact that as in the case of the supranuclear palsies of the facial and bulbar muscles these paralyses of the voluntary ocular movements are more commonly due to affections of the projection tracts from the cortex than of the cortex itself In some cases the disease was familial and progressive probably a primary degeneration of these fibres (von Pallathy Ballet Cantonnet and Taguet)

Effects of Interference with the Visual Reflexes

On turning from this condition characterized by loss of voluntary movement and exaggeration of the fixation reflex to a study of the effects of direct interference with the visual reflexes we encounter considerable difficulties for all these reflexes use the same afferent paths as vision and probably are mediated through the same cortex as that by which visual impressions are perceived Consequently lesions of their afferent fibres or of the cortical reflex centres cause at the same time loss of vision and in absence of vision these reflexes cannot be studied Since however the cortico tectal fibres which constitute the efferent limb of the reflex arc run a dorsal course through the pulvinar they may be involved by lesions which spare the optic radiations as well as the descending fibres from the frontal oculomotor centre Bilateral injury of these cortico tectal fibres is very rare and as part of each fovea from which the more important visual reflexes are excited is represented in both hemispheres of the brain unilateral lesions do not produce striking effects

When we wish to see an object distinctly we usually adjust or move our heads so that our eyes in their position of rest are directed on it this posture of the eyes demands little if any effort and voluntary action alone may suffice to keep it up It is often by rotating our heads too that we follow a moving point or a series of closely spaced objects as in reading The fixation reflex is therefore not essential and its absence causes no pronounced disturbance But when the eyes are turned widely from the middle line the maintenance of the new position demands considerable effort and it tires rapidly even when supplemented by a normal fixation reflex but as long as the deviation is kept up fixation is accurate If however the reflex is defective fixation cannot be maintained accurately by voluntary effort alone though the ocular movements are unimpaired This disturbance is most commonly seen on deviation of the eyes to one side When the patient is asked to look at an object to this side he moves his eyes promptly towards it but he fails to keep them directed steadily on it they quickly recede towards their position of rest and are brought back by a series of jerks which are obviously voluntary In following a moving object, especially if the rate of movement is not uniform or if his head moves while he attempts to fix a stationary point, the difficulty in keeping up fixation is even more pronounced the necessary ocular movements are possible but the reflex maintenance of the position obtained is deficient This failure to fix accurately is generally more pronounced the further the object to be fixed is from the middle line, in other words it is roughly proportional to the muscular effort which the deviation requires

When this disturbance is bilateral the symptoms are more striking The patient complains of inability to see distinctly or to focus properly When his head is not steady as when he walks or rides in a carriage the difficulty in obtaining clear vision of any object is even greater That it is not merely due to diplopia or failure of fusion of the retinal images is evident as it persists when one eye is closed Orzechowski has given an excellent description of this condition in two patients their eyes oscillated about the object they tried to fix they were unable to seize or hold objects with their eyes especially on deviation to one side in reading they failed to follow accurately letters or lines moving objects could not be accurately followed by the eyes and when walking or in motion they were unable to recognize or distinguish objects by vision Erb and others have observed similar cases

Here there is no question of ocular palsy or of nystagmus from which the condition differs in its manifestations and in the disturbances it produces vision is normal or at least adequate scotomata are not present and there is no defect in visual orientation—to any of which inability to fix accurately may be due There is consequently a state characterized by a failure of fixation though the muscular apparatus of the eyes and its central innervation is intact it is essentially an inability to keep the eyes steadily in a position to which they have been brought by voluntary contraction of their muscles

It is well known that when hemianopia is present the patient often fails to keep his eyes accurately on a point to the hemianopic side even when they are directed towards it This had been usually attributed to the loss of vision but as his gaze may remain fixed on a point directly in front of him—that is when his eyes are in their position of rest—it is obvious that this cannot be the only cause Further this failure to fix may be present even when there is some degree of macular sparing The more probable explanation is that the voluntary movement is not supported by the fixation reflex which is normally mediated by the damaged or isolated visual cortex

Inadequate fusion or defective accommodation may be partly responsible for the disturbances of vision of which these patients complain One of my patients said he could not fix his eyes steadily and that they tended to roll about another that she could not focus and that on attempting to read the letters ran into one another In neither of these cases could diplopia be demonstrated yet both read more easily with one eye closed the fusion reflex by which the coalescence of the two images is effected in binocular vision was evidently at fault Bielschowsky has also described loss of fusion in a case with lesions in each occipital lobe

We have seen that when the fixation reflex is not under the control of other cerebral mechanisms there is a tendency to exaggeration of its function with the result that the eyes cannot easily be diverted from the object on which they are directed In these cases on the other hand the fixation reflex is defective and post mortem evidence goes to show that this defect is due to interruption of the cortico tectal fibres which form the efferent limb of the reflex arc In my own cases which were verified the disease involved the dorsal portion of the thalamus including the pulvinar

These two series of observations are complementary The most striking feature in the one series was loss of deficiency of voluntary movement associated with a tendency to persisting fixation of the eyes on a point in central vision from which they could not be easily diverted by will or even by the intervention of other reflexes unless central retinal impulses were suppressed In the other series the subject was unable to keep up fixation accurately particularly when he or the object to be fixed was in motion, and in some cases fusion and accommodation were probably disturbed too

These observations have emphasized the reflex nature of fixation, but there can be no doubt that under normal

conditions fixation is partly voluntary The fixation reflex, however, supplements and steadies the voluntary effort, but it is, on the other hand, under the control of volition On the normal co ordination of these two functions the accurate and purposeful use of central vision depends

The Brain and Oculomotor Activities

We can now consider what parts of the brain are concerned in these oculomotor activities and then discuss how in normal life they work together

All evidence at our disposal indicates that the frontal oculomotor centre is concerned in those movements and reactions of the eyes which we may call voluntary Through it we can by an effort of will look or turn our eyes in any direction and converge them on a near object By it, too, we can keep our eyes directed on any object that interests us, though this is largely a function of the occipital cortex

The functions of the occipital centre are more numerous Fusion—that is the reactions necessary to unify the separate impression from the two retinae—and accommodation depend on it The movements of the eyes to an object outside central vision, in so far as it is involuntary, is also excited through the occipital cortex by extrafoveal impulses And finally the maintenance of fixation on a point, whether it is at rest or in movement, is determined by a cortical reflex mechanism in the occipital lobes

The abrupt turning of our eyes to an unexpected sound or towards a peripheral stimulus is a more complicated reaction which implies spatial localization, the evidence as to the oculomotor centre through which these movements are effected is incomplete, but the frontal cortex is probably concerned in them, for what we know of its organization indicates that no part of the cortex is devoted exclusively to so called voluntary activity In other reactions, as blinking and aversion of the eyes from threatening gestures and in ocular movements which imply judgment of the nature of the stimulus and of its position in space, more extensive areas of the cortex are involved The reaction to threats can be, for instance, abolished by small lesions of the parietal lobe, and the experiments of Rademaker and Gelderblom show that in the cat the associated closure of the lids depends on the integrity of the sensorimotor cortex The movements of our eyes in response to labyrinthine and other proprioceptive impulses is effected by subcortical mechanisms the forebrain is not concerned in them

The integration or harmonious working of the different parts concerned in ocular movements and postures is to some extent revealed by the disintegrations of these functions which we have studied and these serve also to illustrate other activities of the cortex

In the evolution of the brain vision is the first sense organ to obtain a presentation in the cortex of the forebrain Even in birds fibres carrying retinal impulses reach what is regarded as the original neopallium it is only later in evolution that other sense organs attain cortical connexions and it is still later that so called motor centres appear With vision too, localization in the cortex reached its acme for every point of the retina is represented rigidly in it then the brain it seems may speak teleologically decided that such a rigid relation was unsuitable to its further development and developed more plastic organization for its later evolved powers It is consequently not surprising that cortical visual reactions are more highly organized and possibly function on simpler plan than other cerebral activities

Even in birds the original visual cortex is connected with the roof of the midbrain by efferent fibres—the tractus occipito mesencephalicus of Kappers—which are probably the homologue of the cortico tectal fibres of mammals and by means of these the cortex may be able to influence reactions, including ocular movements and postures in response to retinal stimuli As the cortex became the main, and finally the exclusive organ for visual perception the primary visual reactions—as reflex direction of the eyes to light, accommodation, fusion when binocular vision was acquired, and fixation—were transferred to it till in man they can be evoked through it only The next step in development was the appearance of associational areas around the visual cortex which enable it to co operate with other sense impressions and to elaborate further the faculties of spatial perception discrimination and recognition At this stage in evolution control of visual reactions by higher cerebral functions—as consciousness, attention, and discrimination—became necessary, and the newer cortex of the frontal lobe was given this task Now that the exploration of space by the eyes and the direction of gaze towards any object of interest no longer depended wholly on visual impression, reactions to vision were no longer confined by the fatality of a reflex there was now a mechanism by which behaviour and reactions to environment could be greatly extended This is the primary significance of the development of a frontal oculomotor centre

But in order that a highly evolved function can adequately serve its purpose it is essential that it can control subordinate mechanisms, so the frontal cortex became not merely an organ from which ocular movements could be evoked, it acquired also the power of inhibiting inappropriate and undesirable activities of the occipital lobes The importance in ordinary life of this faculty of inhibition is demonstrated by the existence of the fixation reflex when the voluntary motor centres of the frontal lobes are out of action, the eyes then become fixed on an object to the exclusion of the rest of the environment

Conclusion

We can therefore conclude that in normal conditions there is an accurately adjusted co operation between parts of the cortex concerned in ocular movements Through the occipital centres some visual reflexes evoke *movements* which turn our eyes towards objects in the field of vision other reflexes determine by fusion and accommodation the accurate perception and the continuation of binocular images others keep the eyes fixed on any point which claims attention or excites interest The frontal centres make possible the turning of gaze in a desired *direction* and the exploration of space but they also keep under control or inhibit reflexes that are inappropriate to our conduct or our reactions to the world around us

The College of Physicians of Philadelphia has awarded the Mütter Prize to Dr Richard J Shope of the Rockefeller Institute for Medical Research Princeton N J for his recent researches on the aetiology and epidemiology of influenza The prize was established by the late Dr Francesco de Costa Matteucci a native of Lisbon Portugal and a Fellow of the College of Physicians and is awarded annually by the College of Physicians of Philadelphia on the death of the testator *July 1st 1938* to the author of the best memorial or unpublished essay upon any subject in medicine or surgery which may be deemed worthy of the prize

CHRONIC MASTITIS AND BREAST CANCER

A FAMILY HISTORY OF FIVE SISTERS

BY

W. SAMPSON HANDLEY, M.S., F.R.C.S.

Consulting Surgeon to the Middlesex Hospital

(WITH SPECIAL PLATE)

This history of a family of five sisters pursued by breast cancer covers a period of about nineteen years during which with regrettable gaps hesitations and refusals of advice I have been jointly responsible with their own doctors for their defence against the family foe. It is known that their mother died at the age of 69 of cancer of the liver and her mother at the age of 37 of abdominal cancer probably gastric since it was attended by persistent vomiting.

In advising this family I have been guided by the following convictions:

(*a*) Chronic mastitis is a precancerous condition.

(*b*) Chronic mastitis is often amenable to deep x-ray treatment without operation and consequently deep x-ray or radium treatment may be an effective prophylactic against cancer.

(*c*) *The protection afforded by x-rays is neither absolute nor* permanent, and cases so treated should come every three or six months for re-examination.

(*d*) Cases of chronic mastitis in immediate danger of cancer present recognizable clinical peculiarities and should generally be treated by mastectomy.

(*e*) Breast cancer should be treated by radical operation with simultaneous radium to the internal mammary glands and subsequent moderate prophylactic x-radiation. Exceptionally Keynes's radium method may be preferable.

Five separate breast cancers in the family have been treated by radical operation—four by myself and one by Mr. Turner Warwick—and in addition two simple mastectomies have been done—one for incipient cancer the other for precancerous mastitis. In the result two of the sisters have died of breast cancer and three are well at the time of writing. The two sisters who died survived operation eleven and nine years respectively. These results in the face of intense predisposition to the disease in a bilateral form offer encouragement to my belief that routine mastectomy for chronic mastitis—a policy equally distasteful to patient and surgeon—can be safely rejected in favour of x-ray treatment followed by periodic examination with mastectomy in reserve if danger signals show themselves.

If I have described these cases at length it is partly because close personal observation of such a group over such a long period is perhaps unique but mainly because in these histories the whole important question of the prevention of breast cancer is involved. To avoid a running commentary upon the case histories I here submit some general remarks upon the nature and treatment of chronic mastitis.

Clinical Characters of Chronic Mastitis

It is rare for the induration of chronic mastitis to affect the whole breast. The upper and outer quadrant of the breast is the seat of election as for carcinoma and the fact emphasizes the genetic link between the two conditions. The indurations of chronic mastitis affect the breast by lobes and consequently like the lobes themselves they are sector-shaped broader or narrower according to the number of adjacent lobes affected, often multiple in the same breast and sometimes symmetrical in the two breasts.

For their appreciation a special technique of examination is necessary, resembling that of a cat treading its bed preparatory to lying down. A displacement of the swelling upon the pectoral produced by alternate pressure of the two hands lightly laid upon the skin enables its outline and character to be accurately determined as it slips to and fro under the fingers. Except in the cystic form of mastitis it is not a defined lump but a finely granular induration. None of the signs of contraction or adhesion is present. The glands if enlarged are soft and often tender.

Chronic Mastitis—a Precancerous Condition

It is impossible within the scope of this paper to marshal the evidence that chronic mastitis tends to end in carcinoma. In my book (Handley 1931) I believe I have proved that chronic mastitis and eventually carcinoma arise within local areas of lymph block in particular lobes of the breast. The lymphatic block results from lymphangitic surface infections often unnoticed of the main ducts near the nipple. A state of papillomatous hypertrophy within the smaller ducts is seen in the later stages of chronic mastitis as Lenthal Cheatle showed and this is the immediate precursor of carcinoma. All the stages of the process from simple lymph stasis through chronic mastitis to early carcinoma can often be demonstrated in the same breast.

Hormones and Chronic Mastitis

Normal physiology—the rapid development of the breasts at puberty and the recurrent monthly congestion and tenderness of the breasts just before each menstrual period—demonstrates the important influence upon the breast of the ovarian hormones. Lewis and Geschickter (1934) showed that the injection of oestrin into the breasts of male monkeys produced a feminine type of breast, a condition of gynaecomastia. Lacassagne (Cheatle 1935) experimenting on young male mice found that a course of oestrin injections produced in some weeks a cystic mastitis terminating in carcinoma. Cramer and Horning (1936) showed that heavy doses of oestrin produce degeneration of the adrenals together with an initial stimulation followed by subsequent destruction of the anterior pituitary. Quite recently they have found that these changes in the anterior pituitary produced by oestrin can be kept in check if the thyrotropic hormone of the anterior pituitary is injected in suitable doses. They further find that the administration of this thyrotropic hormone to females of a strain of mice in which half the females die of spontaneous mammary carcinoma affords apparently complete protection against the disease (Cramer and Horning 1938). The therapeutic hint of this striking piece of work is obvious but it will take some years to test the suggestion it contains. The lymph stasis theory of chronic mastitis and cancer to which I have referred is perfectly consistent with the view that hormones play an essential part in the causation of these diseases. It is obvious that local areas of lymph obstruction must necessarily be areas where the hormone supply is defective for the regular flow of the tissue fluid through these areas is more or less arrested. Hormones may fail to reach such areas or may accumulate in them to excess. Lymph stasis supplies the localizing factor which determines the site where the cancer arises.

Treatment of Chronic Mastitis

It has been fashionable of late years to treat chronic mastitis empirically by oestrin. The experimental evidence just detailed would seem to show that the treatment is irrational and possibly dangerous. I have recently seen a case of cystic mastitis in which the patient herself was convinced that her breast trouble dated from a course

of oestrin injections Whether treatment with interior pituitary thyrotropic hormone will succeed in preventing human cancer is a question yet to be decided It may prove difficult as in the case of tuberculin to get the remedy to the actual seat of the disease Meantime we have at our disposal a method of proved value

X RAY TREATMENT

In 1910 I advocated the x ray treatment of chronic mastitis and ever since in hundreds of cases I have advised its use instead of mastectomy, with good results Pain promptly disappears and in a few weeks obstinate mastitic indurations often completely vanish The proof that by this treatment many breast cancers have been prevented is naturally very difficult but the evidence which I reserve for another paper, raises a presumption that such is the truth

Danger Signals in Chronic Mastitis

The characters of chronic mastitis in young women have just been described As the cancer age approaches the disease may show one or more of the following danger signals all of them dependent upon the formation of adventitious fibrous tissue in the affected lobe or lobes These signs cannot here be described in detail They are

NIPPLE CHANGES

1 Retraction of one or more of the duct orifices upon the nipple without retraction of the nipple itself
2 Serous or blood stained discharge from the nipple
3 Deviation of the axis of the nipple
4 Elevation of the nipple
5 Appearance upon the nipple of white or black dots from which plugs of degenerate epithelium can sometimes be squeezed
6 Flattening of the nipple
7 Retraction of the nipple

BREAST CHANGES

1 Appearance of multiple hard elastic or fluctuant lumps in the mastitic area (cystic mastitis)
2 The presence near the nipple in the mastitic area of radiating tortuous cords which are thickened main ducts
3 Adhesion of the breast to the skin or the pectoral fascia is rarely seen except in fully developed carcinoma

Case Histories

The case histories, subsequently to be given in detail, are summarized in the following table

	Date of Birth	Right Breast	Left Breast	Result
Sister A	1871	Mass appeared in 1930 just before death (Second primary carcinoma)	Primary carcinoma 1919 (Radical mastectomy)	Died 1930 with signs of pyloric obstruction due to a primary gastric growth or to secondary abdominal masses
Sister B	1875	Primary carcinoma 1925 (Radical mastectomy)	Primary carcinoma 1937 (Radical mastectomy)	Alive and well 1938
Sister C	1879	Proliferative mastitis and incipient carcinoma 1933 (Simple mastectomy)	Proliferative mastitis 1930 (Simple mastectomy)	Alive and well 1938
D	1885	Mastitic induration 1930 (Surface radium treatment)	Mastitic induration 1929 (X ray treatment)	Alive and well with normal breasts 1938
Sister E	1886	Second primary carcinoma 1927 (Radical mastectomy)	Primary carcinoma 1923 (Radical mastectomy)	Died in 1932 of recurrence in supraclavicular glands sternum and spine

SISTER A BORN 1871 UNMARRIED

In 1919 I operated upon this patient for a carcinoma in the lower outer quadrant of the left breast The growth had been present since 1918 was 2½ inches in diameter, and was adherent to skin and muscle though clinically the axillary glands were not enlarged Microscopical section showed a regular spheroidal cell carcinoma with considerable tubule formation but the axillary glands were free from growth

She remained in good health until 1929 when she began to suffer from arthritis of the spine and hip Radiographs showed no evidence of secondary bone deposits In November of the same year I again saw her she was then suffering from a neoplasm of the stomach with pyloric obstruction Her condition was hopeless and did not admit of radiography of the stomach It was impossible to say whether the neoplasm was primary or secondary She died in January, 1930 her doctor Dr A M Barlow reported that a few weeks before death a lump (? a second primary carcinoma) appeared in the right breast

On the whole it appears likely since her mother possibly and her grandmother probably died of gastric carcinoma that death was due to a primary neoplasm of the stomach

SISTER B, BORN 1875, MARRIED

The patient was first seen in 1920 She had had an abscess in the left breast after a miscarriage and a narrow sector shaped mastitic induration containing two small nodules thought to be cysts was found above and internal to the nipple The left nipple was elevated but in view of the history of abscess the importance of this sign was minimized The right breast was normal I asked to see her in six weeks time but it was not until 1925 that she again appeared with a typical carcinoma of the right breast Vague induration could be felt in the left breast at the site of the cysts but it was otherwise normal A right radical mastectomy was done and microscopical examination of the specimen showed a carcinoma with no involvement of the axillary glands

In 1927 she was well but a thickened duct could be felt a short distance above the left nipple Deep x ray and surface radium treatment was given during 1927 and 1928 In 1930 a precautionary left mastectomy was advised but the patient declined operation and another course of deep x ray treatment was given In 1934 thickened ducts had again appeared, and operation was urged but without success

In 1937, five years after the last x ray treatment, a hard lump adherent to the skin appeared in the upper and outer quadrant of the left breast just outside an area of x ray telangiectasis present above the nipple since 1931 Mr Turner Warwick performed a radical mastectomy and pathological examination showed a cellular spheroidal cell carcinoma without axillary gland invasion The patient made a good recovery from the operation and is at present well It is interesting that the carcinoma appeared outside the area of telangiectasis I have never seen a carcinoma develop beneath such an area but I can recollect at least one other case in which a carcinoma appeared just beyond the margin

The history of this case shows that the protection against carcinoma afforded by x rays is not absolute and *permanent* It also emphasizes the need for three monthly or six-monthly re examinations of the abnormal breast and for repeating the x-ray course at least every two or three years It is to be noted that the breast was watched and treated for fourteen years before its removal was urged, and that frank carcinoma did not supervene until three years later This is prima facie evidence that it is possible to distinguish the onset of the dangerous stage of chronic mastitis

SISTER C, BORN 1879, MARRIED

In 1927 this patient was sent to me by Dr Barlow for pain in and under the left breast She had cardiac weakness and irregularity following influenza, with a bruit over the lower sternum, and was subject to indigestion All remaining teeth had been extracted a year before

On examination a sector-shaped mastitic induration was found in the upper quadrant of the left breast In it near the nipple could be felt tortuous thickened ducts The left nipple was higher than the right and pointed forwards and outwards while the right pointed normally—that is forwards outwards and downwards Owing to these signs I regarded the breast as a dangerous one but in view of the cardiac condition x-ray treatment was advised in preference to mastectomy A month later the left breast appeared almost normal except that some thickened ducts persisted above the left nipple On this occasion some thickened ducts were felt above the nipple of the other (right) breast In June 1928 both breasts were much improved In May 1930 there was a slight duct thickening above the left nipple and further x ray treatment was given to both breasts by Dr Russell Reynolds The left nipple was still raised and deviated

In September 1930 following a blow on the left breast a small lump a quarter of an inch in diameter and adherent to the skin was found in the left upper and outer quadrant I diagnosed carcinoma The pathologist reported that the lump was a cyst and that the breast only showed chronic mastitis A simple mastectomy was done Re-examination of the slide has convinced me that the duct epithelium was in a precancerous condition

In March 1933 a mastitic swelling containing thickened tortuous ducts appeared above the right nipple and I urged a simple mastectomy with removal of the glands This was done The breast showed advanced fibrosis with microcystic distension of the smaller ducts and proliferation of their epithelium At certain points the breast showed diffuse papillomatosis of the ducts still innocent (Plate Fig 1) At one point there was seen a duct distended by epithelium with definite infiltration of the surrounding tissues—an incipient carcinoma (Fig. 2) Glands were not infected Subsequently a course of *x* rays was given

This case confirms the evidence of the preceding one as to (1) the controlling power of irradiation in chronic mastitis (2) the need for periodic examinations in such cases (3) the value of the danger signals which herald approaching malignancy

SISTER D BORN 1885 MARRIED WITH TWO CHILDREN

The patient first presented herself in 1929 because of discomfort and pain in the left breast of twelve months duration Examination showed a slight mastitic thickening in the upper inner quadrant of the left breast which was tender There were no other signs in either breast The induration disappeared after a short course of x ray therapy

In 1930 an indurated area was noted in the region of the axillary tail of the right breast but this also subsided under surface radium treatment The breasts were normal when the patient was last seen in October 1937

SISTER E BORN 1886 MARRIED

This patient was operated upon by me at the Middlesex Hospital in December 1923 for an advanced carcinoma of the left breast when aged 37 Radium tubes were introduced in the upper intercostal spaces and a patch of radio dermatitis developed a month later over the inner end of the third space

She does not appear to have been seen again until September 1927 At this time two patches of radio dermatitis were present at the inner ends of the third and fifth left spaces In the right breast in the upper and outer quadrant was a defined granular sector shaped thickening an area of chronic mastitis The right nipple seemed less prominent than normal and was flame-shaped in contour in the plane of the skin with the point directed towards the mastitic thickening There was no definite adhesion to the skin but a very faint depression appeared over the induration when the breast was displaced I advised removal of the right breast but as an alternative owing to the reluctance of her relatives offered x ray treatment with re-examination in two months The axillary glands were not enlarged There was no recurrence on the left side I wrote to her medical adviser Dr Barlow There seems to be some danger that this patch will develop into a carcinoma and removal of the right breast would be a wise precaution since the second breast in a patient who has had carcinoma is four times as likely to develop carcinoma as the breast of a normal woman

By October 1927 after one dose of deep x rays which gave her acute pain in the breast and made her ill for some days the patient had made up her mind to undergo operation A faint but unmistakable skin dimple could now be elicited over a small lump beneath the edge of the right great pectoral at the periphery of the breast The mastitic swelling had become less definite probably as the result of the x ray dose The flame shape of the nipple was still evident A diagnosis of second primary carcinoma was made and immediate radical operation was urged and performed Histological examination showed a spheroidal cell carcinoma without invasion of lymph glands considered to be a second primary carcinoma

In June 1928 she was free from recurrence though suffering from inginal attacks but she then escaped from observation In May 1930 I was informed that she was having radium treatment for enlarged glands in the neck A sternal recurrence was subsequently treated by buried radium In 1932 spinal secondary deposits appeared and she died in 1934 after being bedridden for two years

In the history of this case the regrettably long intervals between examinations are to be specially noted

Commentary

The history of this unfortunate family recalls the high incidence of breast cancer found in certain inbred laboratory strains of mice Dr W E Gye (1936–7) makes some interesting observations on these strains He says

Inbred strains of mice are very useful in some branches of experimental cancer research The discovery of the carcinogenic property of oestrone was made with such a strain and the analysis of the chain of events which ends in malignancy of the breast is simplified by the use of pure strains of high and lower cancer incidence But as Dr Cramer has pointed out inbred mice are not normal animals and in high cancer lines the clinical picture of cancer is distorted by the predominating influence of one aetiological factor—inherited susceptibility in a particular organ—to such an extent as to minimize the importance of other factors. Conclusions drawn from observations on such strains cannot therefore be applied without reserve to cancer of normal mixed stocks In high cancer strains for example multiple tumours of the breast are of frequent occurrence whereas in mixed stocks single tumours are the rule If a cancer in a high strain is excised surgically the animal though cured of this particular tumour is liable to develop a second or a third independent growth in another part of the same breast or in the breast of the opposite side The inherited predisposition to cancer of the breast is not affected by the removal of the first tumour and surgical treatment in these exaggerated artificial circumstances is ineffectual and appears to be irrational In mice of mixed strains surgical removal of a tumour is not followed by the appearance of fresh independent new growths if local recurrence takes place it is due to incomplete removal of the primary tumour The differences between cancer in pure line strains and in mixed stocks may have their counterpart exhibited less strikingly in human surgery

How far are these conclusions supported for human carcinoma by the facts I have related? The fact that three of the five sisters are still living free from pain and from signs of recurrence partly as the result of radical mastectomies for developed cancer partly as the result of simple mastectomies for threatening precancerous conditions shows that in the human race (which fortunately has only two breasts) surgical treatment may be worth

while however strong the constitutional predisposition to breast cancer Though I believe radiation to be a valuable prophylactic, it cannot in all cases be an efficient substitute for surgery Indeed the impermanence of the protection it affords is manifest in the case records

Dr Gye's statement that 'in mice of mixed strains surgical removal of a tumour is not followed by the appearance of fresh independent new growths' is far from being applicable in the ordinary case of human breast cancer with no specially strong family history My experience is that I see an increasing number of cases of second primary carcinoma of the opposite breast I hope to diminish that number in future by advising routine post operative irradiation of the remaining breast and by even more careful following up of cases

Summary

This paper records the history of five sisters descendants of a cancerous mother and grandmother who have been under my observation for nineteen years There is evidence that three of them have suffered from double primary carcinoma of the breast One sister was treated by irradiation for bilateral chronic mastitis, which has not recurred The remaining sister was treated for chronic mastitis by irradiation, at first with success but after three years a left simple mastectomy seemed necessary and three years later a right simple mastectomy The right breast showed an incipient carcinoma The danger signals which herald the onset of carcinoma in such cases are described and it is held to be possible to distinguish between cases of chronic mastitis which may safely be treated by irradiation and cases in the precancerous stage needing mastectomy Two of the sisters have died of breast cancer surviving operation eleven and nine years respectively and three remain well Five radical mastectomies and two simple ones have been done

Dr Henry Herd, school medical officer for Manchester, in his annual report for 1937 records the transfer to his department of a child guidance clinic which was formerly run on voluntary lines The present tendency to make use of the school clinics for early consultation, in preference to awaiting the next routine visit of the medical officers is shown by the rising ratio of 'special' to "routine" inspections During the year under review some 33 000 routine inspections were undertaken, as compared with nearly 49 000 special inspections The nutritional grading required by the Board of Education was continued during the year An analysis of the very different findings of a group of officers confronted with the same batch of children, the grading being based on general observation only bears out Dr Herd's view that the economic test which reveals that a child can, or cannot be receiving an adequate diet on the income available for feeding him, is still the only reliable and practicable method capable of application on a large scale to the assessment of nutrition The scope of this report is as wide as ever, and it includes a paper on the physical fitness of schoolboys, with special reference to nutrition and the mechanism of heredity

DYSFUNCTIONAL UTERINE BLEEDING TREATED WITH PROGESTERONE*

BY

J. N. MACGREGOR, M.D., F.R.C.S.Ed., M.C.O.G.

Gynaecologist Deaconess Hospital Edinburgh Late Tutor in Clinical Gynaecology Royal Infirmary Edinburgh Crichton Research Scholar

(WITH SPECIAL PLATE)

Although towards the end of last century it was suggested that irregular uterine bleeding was associated with abnormal ovarian function it is only within comparatively recent times that this has been confirmed by scientific data The dysfunctional nature of irregular uterine bleeding was disclosed when the endometrial structure and hormone findings in such cases were correlated with the endometrial changes and hormone concentrations occurring cyclically during the normal menstrual process It is known that menstrual rhythm is founded on the harmonious interaction of the gonadotropic hormone of the anterior pituitary and the oestrogenic and luteal hormones of the ovaries Several factors however particularly dysfunction of one or more of the other glands in the endocrine chain and abnormal nervous stimuli, may affect this intimate relationship

The present communication records a study of *thirteen* cases of irregular uterine bleeding that was essentially associated with a disturbance of the pituitary ovarian mechanism

Types of Bleeding

Two types of bleeding only are considered—namely, ovular and 'anovular

Ovular Bleeding—By this term is implied bleeding which may occur at or near the time of ovulation about the middle of the cycle This phenomenon, which has been noted by many observers (Hartman 1932 Hain 1934) is probably due to a disturbance of the hormonal equilibrium at the time of ovulation In such cases it is presumed that between the time of rupture of the Graafian follicle and the formation of the corpus luteum there is a transient lowering of the blood concentration of oestrin Consequent on the fall of blood oestrin there is diminished endometrial stimulation, which is sufficient to induce partial disintegration of the endometrium with bleeding When the corpus luteum is mobilized, however, the endometrial stimulation is restored and the haemorrhage subsides

Anovular Bleeding—As distinct from anovular *menstruation* this term is synonymous with that of metropathia haemorrhagica The pathological findings in this condition are cystic degeneration of the Graafian follicles with no recent or forming corpus luteum in the ovary myohyperplasia of the uterus and marked proliferation of the endometrium with cystic dilatation of the glands (Plate Figs 1 and 5) The cells lining the glands are cubical, with centrally placed nuclei, no glycogen is found in the cells (Figs 2 and 6) This characteristic pathological picture may result from (*a*) an upset in the pituitary-ovarian mechanism or (*b*) a local pelvic lesion interfering with the normal process of ovulation

Mechanism of Bleeding

Ovular bleeding, it has been suggested, is associated with a lowering of the blood concentration of oestrin

* A Report to the Therapeutic Trials Committee of the Medical Research Council From Dr Douglas Miller's Gynaecological Clinic, Royal Infirmary Edinburgh, the Deaconess Hospital Edinburgh and the Institute of Animal Genetics, Edinburgh University

the time of ovulation and it is probable that a similar factor operates in metropathia haemorrhagica Clinically and experimentally it has been demonstrated that endometrial stimulation can be maintained for long periods provided an adequate amount of oestrogenic hormone is administered The withdrawal of the hormone however is followed by endometrial disintegration In metropathia haemorrhagica therefore there must be some factor which initiates a lowering of blood oestrin

I have several times confirmed the observation made by many investigators that the large follicular cysts found in the ovaries in cases of metropathia haemorrhagica contain a fluid which has oestrogenic properties There are therefore in these cases depots of oestrin in the ovaries which supply a continuous amount to the general circulation and thus endometrial stimulation is sustained Gradual intracystic tension however may cause either atrophic changes in the secreting cells or compression of the blood vessels Whatever the cause the direct result is a reduction of the hormone passing into the general circulation Although it was shown by Corner (1927) and Hartman (1932) and subsequently confirmed by others that oestrin withdrawal causes uterine bleeding it was not until Markee's (1936) experiments on monkeys were carried out that the mechanism of this phenomenon was demonstrated He showed that diminution in the blood concentration of oestrin causes vasoconstriction of the endometrial capillaries Consequent on this vascular spasm the nutrition of the highly proliferated glandular structure is impaired Partial necrosis results with consequent shedding of the endometrium

Diagnosis

The history obtained in cases of anovular bleeding is characteristic There is usually a period of six to ten weeks amenorrhoea followed by prolonged bleeding of from four to eight weeks duration In cases of ovular bleeding there is a history of frequent loss which in some cases occurs regularly every fourteen days It is sometimes necessary to remove endometrium on several occasions in order to distinguish between the ovular and true menstrual bleeding Although a diagnosis of these conditions may be made on clinical evidence this should be confirmed by histological examination of the endometrium In the early years of reproductive life a thorough examination of the genital tract including measurement of the length of the utero-cervical canal and microscopical examination of the endometrium furnishes information which is of value in determining the form of therapy most likely to be beneficial This examination including in particular biopsy, is essential near the menopause as the possibility of carcinoma being the cause of the bleeding must always be excluded

Treatment

Progesterone was the form of therapy used in the present investigation Initially 1 to 2 mg were given daily or every second day, but when more abundant supplies became available 5 mg were given daily In ovular bleeding the treatment was given two or three days before the expected anomalous bleeding the aim being to maintain endometrial stimulation during the time of ovulation and thus tide over the period when the blood oestrin was lowered The administration of oestrin at this time by preventing a diminution of blood oestrin, produces the same effect As is known however oestrin at a certain concentration inhibits the anterior pituitary and accordingly it is possible that this form of therapy may by influencing the pituitary stimulus, delay or inhibit ovulation Theoretically therefore the former method of treatment is preferable

In metropathia haemorrhagica progesterone may be given at any phase During the bleeding stage 5 mg were administered daily until the bleeding was controlled During the amenorrhoeic phase 5 mg were given daily the total dosage amounting to 25 to 30 mg Though oestrin therapy may by sustaining endometrial stimulation control the haemorrhage in these cases the effect is only a temporary one Indeed oestrin would only aggravate the condition and its withdrawal would be followed by still more haemorrhage Accordingly this form of therapy is definitely contraindicated

Data and Results

Thirteen patients were treated with progesterone five were cases of ovular bleeding and seven of anovular bleeding whilst one case, though treated with progesterone was found to come under another category

Ovular Bleeding—As the result of treatment three patients have had regular menstruation for the last eighteen to twenty two months One patient studied over a period of eighteen months had three regular periods after cessation of therapy She then became pregnant but aborted at the end of the second month of gestation (Chart I) The other patient though not completely well

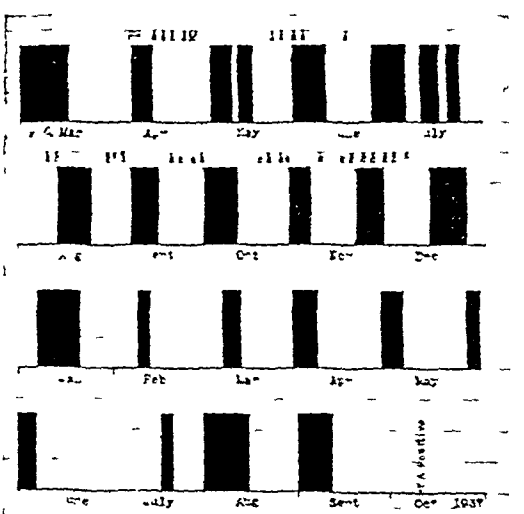

CHART I—Case 4 aged 30 Menarche at 12 Menstruation regular 7-8/28 until the age of 25 Since then menstruation has been irregular 7 21/17 21 Biopsy curettage carried out on two occasions indicated that ovulation was occurring but was associated with bleeding The chart indicates the effect of treatment Doses of progesterone were given on the following days 1936 April 7 8 9 10 15 18 21 and 25 1 mg April 27 and 28 2 mg May 24 27 and 31 and June 3 14 17 and 21 and August 10 and 13 1 mg August 30 and September 1 and 4 5 mg September 20 23 27 and 30 and October 19 22 26 and 28 and November 8 1 mg November 15 18 22 25 and 29 and December 2 and 6 2 mg

has now only a brownish discharge whereas formerly she had frank haemorrhage for a few days between every two periods

Anovular Bleeding—In four cases of anovular bleeding menstruation became normal in duration and periodicity In two cases however there has recently been a recurrence of the irregularity This has been attributed by one patient to a nervous turn following the sudden death

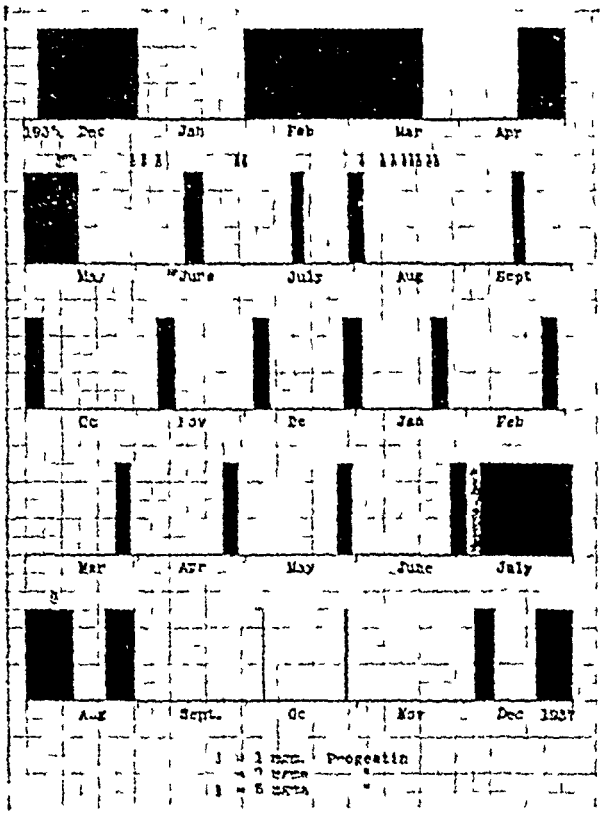

CHART II—Case 6 aged 31 2 para Menstruation 4 7/21-28 day type since the menarche at the age of 13 till December, 1935, when period lasted from December 5 1935 to January 1 1936 After an interval of four weeks, bleeding began again in the beginning of February and lasted until March 23, 1936 when a diagnostic curettage was carried out Basal metabolic rate + 7 per cent Blood sugar tolerance 88 mg per 100 c cm after 50 gm glucose, 100 119, 99 90 and 90 mg per 100 c cm The diagnosis of metropathia haemorrhagica was confirmed by histological examination of the endometrium Doses of progesterone were given on the following days 1936, May 10 11, 12, 13, and 14 2 mg, May 31 1 mg, June 3 7 and 29 and July 1, 2 mg August 3, 9, 12 15 17, 19, 22 and 24 1 mg, 1937, August 8, 2 mg, August 9 1 mg

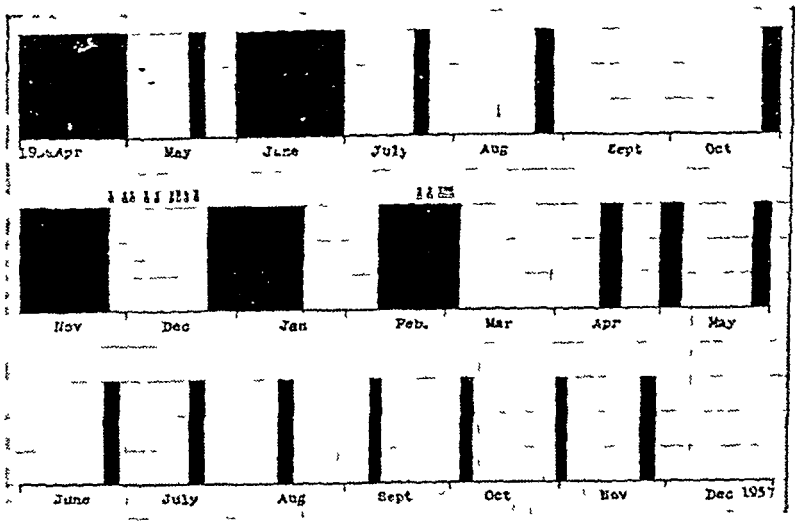

CHART III—Case 7 aged 31, 1 para Menarche at age of 12 Periods were regular 4/28 until birth of child two years ago Menstruation recommenced three months after the birth and was regular 4/28 until April, 1936 The diagnosis of metropathia haemorrhagica was confirmed by histological examination of the endometrium removed on April 30 1936 Doses of progesterone were given on the following days 1936 November 26 and 30 and December 2 6, and 9, 1 mg, December 13, 15, 17, and 20, 2 mg, 1937, February 21, 24, and 27, 2 mg February 28 and March 1 and 2 5 mg

of a near relative while in the other case the patient sustained a shock on falling off a bus (Charts II and III) In the remaining three cases the uterine endometrium was examined histologically before and after treatment, and it is of interest to note that as a result of the treatment the hyperplastic endometrium has been changed into a pseudo secretory phase in two of the cases (Figs 3, 4, 7, and 8) These cases have only recently been under treatment and two have had two normal periods, whilst the third has had one normal period

On the other hand, the following case illustrates the wasteful aspect of the indiscriminate use of endocrine therapy for irregular uterine bleeding

Case 13—This patient aged 13 was first seen on August 17, 1936 Menstruation started in February 1936 and her periods were as follows the first period lasted five days, the second period five weeks later lasted seven days the next period, one month later lasted a similar time the period in May lasted seven days two periods in June lasted seven days, a period started on July 4 1936 and continued until the patient was seen on August 12 Thyroid therapy had no effect on the bleeding Between August 12 and 17 the patient had 10 mg of progestin Bleeding stopped on August 28, but restarted on September 3 and lasted nine days, it was again present from September 24 to October 3 and came on once more on October 12 Between October 19 and 26 the patient had 35 mg of progestin which did not control the bleeding Examination under anaesthesia on October 31 showed that the uterus was small the utero cervical canal measuring only two inches Thereafter she was put on progynon B oleosum forte (oestradiol benzoate) and after a total dosage of 45 mg. menstruation came at regular intervals for five days and has continued to do so

I have indicated that the progesterone treatment in this case was indiscriminate If the patient had been examined initially under anaesthesia and the hypoplasia of the uterus detected progesterone would not have been given, as it would have had no effect on an endometrium which had not been sufficiently primed with oestrogenic hormone

Discussion

The histological appearances of the endometrium before and after the administration of progesterone are significant, in that they demonstrate clearly the effect of this hormone on the endometrium If this were the only action produced, however, this therapy would be of little value as its effect would be merely a local and temporary one I have shown that progesterone therapy, in some cases of metropathia haemorrhagica, was followed by a normal menstrual rhythm This result, it is presumed, has been due to a re establishment of a normal hormonal balance The rationale of this form of therapy is possibly as follows the progesterone brings about an increased elimination of oestrin by urinary excretion or converts it into less physiologically active fractions (Smith, Smith, and Pincus, 1938) This results in a lowering of the blood concentration of oestrin to within normal limits following upon this, that inhibition of the pituitary which has been associated with a high concentration of oestrin is removed The pituitary can now act at a normal level A full

reactivation of ovarian function restores the normal hormonal balance a continuation of which effects the regular menstrual rhythm

Comparatively few favourable results will follow the indiscriminate use of progesterone therapy but in cases where its employment appears to be indicated by the histological structure of the endometrium encouraging results can be obtained Although radium therapy is successful in the treatment of metropathia haemorrhagica occurring at or near the menopause a wider use of progesterone seems to be indicated as a more rational form of treatment

Summary

1 Two types of irregular uterine bleeding are described

2 The mechanism of bleeding in metropathia haemorrhagica is discussed

3 The results of treatment with progesterone are given and the effect of this form of therapy on the uterine endometrium is illustrated by photomicrographs

4 The rationale of progesterone therapy in irregular uterine bleeding is discussed

I wish to express my indebtedness and thanks to Dr Douglas Miller for the privilege of investigating and treating cases under his care and to Professor F A E Crew for the facilities afforded me in his department

The preparation of progesterone used in this investigation was progestin organon and I am grateful to the manufacturers (Messrs Organon Laboratories) who supplied it to me through the Therapeutic Trials Committee

BRODIE'S ABSCESS AND ITS DIFFERENTIAL DIAGNOSIS*

BY

JAMES F BRAILSFORD, M D, Ph D M R C P

Consulting Radiologist City of Birmingham Hospitals

(WITH SPECIAL PLATE)

In the collected works of Sir Benjamin Collins Brodie published in 1865 will be found a paper on Chronic Abscess of the Tibia which was presented to the students of St George's Hospital In this paper he pointed out that an abscess may occur in the interior of any bone in the body but according to his experience we meet with it more frequently in the tibia than in any other bone He gives a brief account of eight cases All the patients except one were males between the ages of 13 and 34 years The abscess was in the upper third of the tibia in four and in the lower third in four The clinical histories indicated that the lesion had existed for periods ranging from five to eighteen years The account of his first case is as follows

Some Early Cases

It was as long since as the year 1824 that I was consulted by a young man 24 years of age under the following circumstances There was a considerable enlargement of the lower end of the tibia but the ankle joint permitted of very motion and was apparently normal The skin was thin tense and closely adherent to the periosteum There was constant pain in the part generally of a moderate character but every now and then it became excruciating keeping the patient awake at night and confining him to the house for many successive days It made his life miserable and his nervous system irritable one effect of which was that it spoiled his temper and thus produced another set of symptoms in addition to those which were the direct consequence of the local malady The disease had been going on for twelve years He had consulted many surgeons respecting it and had used a great variety of remedies but had never derived benefit from anything that was done Instead of getting better he every year became so much worse I tried some remedies without any advantage and at last recommended that he should lose the limb Mr Travers saw the patient with me and agreed with this opinion An amputation was performed and the amputated tibia is now on the table You will see how much the lower end of it is enlarged and that the surface of it presents marks of great vascularity The bone in the preparation is divided longitudinally and just above the articulating surface there is a cavity as large as a chestnut This cavity was filled with dark-coloured pus The inner surface of it is smooth The bone surrounding it is harder than natural On observing these appearances I could not help saying that if we had known the real nature of the disease the limb might have been saved

In another paper he tells us that the patient died a few days after the operation The other seven patients he treated by trephining the bone at the site of the point of maximum tenderness and the release of pus relieved the symptoms and led to rapid cure

In addition to the signs and symptoms recorded in the account of the first case the following are recorded in the other histories

The pain may be of moderate character with periodic exacerbations of excruciating almost intolerable pain and periods of perhaps several months of freedom from all symptoms The adjacent joint may exhibit periodic effusions after exercise which are absorbed with rest One patient had tubercles in the lungs and vomicæ dead bone in the ribs and other complications In one case a sinus communicated with the knee joint The new periosteal bone is softer than normal

Such is the account that Brodie gave to a condition which he recognized as a distinct entity The accuracy of his observations and the value of the method of treatment which he devised were such that though thousands of such cases have been treated by hundreds of different surgeons since his time little if any addition has been contributed to the clinical picture

What Constitutes a Chronic Abscess?

Brodie's clinical work was unaided or as some would express it unhampered by bacteriology or radiology It is therefore impossible to define accurately in the present terms of bacteriology or radiology the nature of the lesion which he described Though in the light of our present knowledge most of his eight cases appear to be of a staphylococcal nature the history of at least one of them suggests the possibility of a tuberculous infection Consequently though we may reasonably refer to any chronic abscess of bone as a Brodie's abscess it would be preferable from the point of treatment to confine the term to abscesses that are due to the staphylococcus These constitute all but a relatively small minority that are attributable to the tubercle bacillus, typhoid bacillus pneumococcus streptococcus etc We are also faced with the question of what constitutes a chronic abscess? Brodie stated that the duration of symptoms in his eight patients varied from five to eighteen years To day, with the ready accessibility of the harmless and painless radio-

* Paper read at the Annual Meeting of the British Association of Radiologists at Belfast May 13 1938

graphic examination such lesions may be detected very early in the course of the disease, and what might in Brodie's day have been allowed to progress for some years before surgical intervention was made is now capable of detection and treatment within a month or so of its onset. For the purpose of this paper I have examined the old radiographs and case histories, and made recent clinical and radiographic examination, of as many as were available of the sixty-two cases of chronic bone abscess which have been submitted to me from time to time during the past fifteen years. The results are shown in the following table.

Table summarizing the Main Features of 62 Cases of Chronic Abscess of Bone (42 males, 20 females)

	Age Period at which Abscess was found						
Years	1-5	6-10	11-15	16-20	21-30	31-40	40+
Number of cases	6	5	19	15	10	5	2
Duration of signs and symptoms at time radiographic evidence was obtained	1 wk. to 6 mths.	3 mths. to 6 mths.	3 mths. to 5 yrs.	3 yrs. to 11 yrs.	1 yr. to 20 yrs.	1 mth. to 10 yrs.	

Site of Primary Bone Focus

Tibia			Femur	Humerus	Ulna	Radius	Fibula
Lower end	Upper end	Mid third					
29	9	2	8	7	4	2	1

Single focus in bone 45 cases. Multiple bone foci, 17 cases.

Analysis of the Cases

Analysing this table, we see that the lesion occurred twice as often in the male as in the female. The majority—that is, forty-four—occurred in the age period of 11 to 30 years. The younger the patient the shorter was the duration of symptoms, though in a few isolated cases, even in adult life, a brief history only was obtainable. In those cases with a long history, starting in some instances in the early years of life, the symptoms had been intermittent, attacks of pain and swelling were followed by long periods during which there was almost complete freedom from symptoms, and it is probably due to this that the lesion was not submitted to radiographic examination. Of the six children under the age of 5 who developed signs and symptoms severe and protracted enough to cause the doctor to seek radiographic examination the lesion in five of them appeared to be due to secondary tuberculous infection.

In some cases radiographic evidence of a septic focus in bone was obtained within a month of the patient complaining of symptoms, but since we are unable to fix the date of invasion of the site by infective organisms from the patient's story we obviously cannot, in the majority of cases, say how long such a lesion has been present. The intelligence of patients, their reaction to pain and discomfort, and their resistance to infection vary considerably, and so does the virulence of the invading organisms. The physical signs also do not materially aid us in our estimation, for even in acute osteomyelitis swelling of the affected limb and redness of its skin are relatively late signs. In the case of the chronic lesion these signs appear intermittently, and though there may be long intervals during which little can be detected, these intervals tend to diminish as the signs become more prominent and intensive.

Upwards of a third of the total number of abscesses were found in the lower end of the tibia. This is in opposition to the findings recorded by other workers in acute osteomyelitis of childhood, when the upper end of the tibia was more often involved. Except in a few instances the primary lesion was seen to be in the metaphyseal extremity of the diaphysis, and by the aid of serial radiographs it was observed that the lesion extended from this site towards the medulla and rarely perforated the epiphyseal joint cartilage. In those instances in which the latter occurred the tubercle bacillus was found to be the infecting organism.

In the majority of cases the periosteum did not show any evidence of reaction, but when the abscess was large and involved the whole extent of the diaphyseal extremity periosteal new bone was evident. This distribution and suggestion of spread of infection is in opposition to the views put forward by Starr with regard to acute osteomyelitis. He produced evidence to show that the infection passes from the metaphysis to the periosteum, stripping the latter from the bone by the formation of a subperiosteal abscess and subsequently infecting the medulla via the Haversian canals. In these cases of chronic bone abscess I am unable to obtain any radiographic evidence of infection of the bone via this route. In nearly one-third of the cases the patients either exhibited evidence of previous septic bone foci or subsequently developed such lesions while others gave a history of tonsillitis, pneumonia, empyema, etc. The duration of the lesion in most cases was so long that the early events in its history were not well remembered, but in no fewer than eight instances there was definite evidence of severe injury to the part preceding the development of symptoms. In some cases the symptoms and signs produced by the trauma passed imperceptibly into the symptoms and signs which have become associated with the bone abscess.

Many of the patients gave a history of having had scarlet fever, measles, and other exanthemata, and in some cases the lesion in the bone developed during or shortly after the infectious illness. In two cases a history of typhoid fever was obtained, and the organism was recovered from the abscess. As in acute osteomyelitis the infecting organism found in the majority of the cases was the *Staphylococcus aureus*.

Physical Signs and Symptoms

The chronic abscess has an insidious onset, quite distinct from acute osteomyelitis, in which the striking clinical features are the sudden onset of severe or even excruciating pain and the development of a point of exquisite tenderness over the primary focus—which the patient guards with fear—associated with rigors, high fever, and rapid pulse, followed by the signs of a severe toxæmia, delirium, and coma. The patient may complain of recurrent attacks of pain which have gradually increased in severity. The pain is often of a boring or burning character, giving the impression of a gradual expansion of the bone from some internal compression and at times it may be almost intolerable. Some patients complained that it was worse during the day when they were walking about, but that it became less on resting and at night. In these cases the affected limb usually became somewhat swollen, the skin reddened, and there was evidence of oedema of the soft tissues over the affected bone during the day, which subsided during the night. In others the pain appeared to be worse at night, none being experienced during the day until resuming in the evening. Attacks of pain of a more severe nature lasting three or four days were followed in some instances by months of freedom. In most cases there was tenderness on pressure over the abscess. In the most acute phases the patient may show a hot, red, tense, fluctuating

swelling with some oedema of the affected limb The adjacent joint at such phases sometimes became swollen and showed signs of effusion into the joint In a few cases superficial abscesses developed and discharged and sometimes definite thickening of the affected segment of bone could be observed

Radiographic Signs

ACUTE OSTEOMYELITIS

Radiographic evidence of acute osteomyelitis for the purpose of diagnosis does not exist By the time the bone shows changes detectable by radiography the shaft will have been denuded of periosteum and sequestra have formed From radiographic examination of septic fingers in which the date of onset can be more accurately fixed I have determined that changes may be found in the affected bones within ten days The earliest sign is localized osteoporosis When the focus is situated in the medulla absorption of the cancellous structure may be evident In less acute lesions no apparent change may be seen for one or two months though there may be highly suggestive clinical signs and symptoms In a patient aged 32 who had complained of pain in his leg for one month radiographs revealed a well-defined area of cancellous destruction in the medulla of the tibia at the junction of the middle and upper thirds with some increased density of the surrounding cortex

SUBACUTE OSTEOMYELITIS

In subacute osteomyelitis physical signs and symptoms precede the development of radiographic signs by a week or more Thus in a girl (D V) aged 10 years radiographs taken one week after the onset of pronounced physical signs and symptoms showed a small ill defined area of osteoporosis at the lower metaphyseal extremity of the tibial diaphysis but a month later radiographs revealed irregular osteolysis of the whole of the lower end of the tibial diaphysis including its compact cortex and an accretion of new periosteal bone which in places also exhibited calcium deficiency It was impossible to define the boundaries of the infected bone Further radiographs after another month showed that calcium had been deposited and there was now increased definition in the affected zone evidence of consolidation and localization of the process and more regular ossification of the new periosteal bone No evidence of sequestra formation could be found

CHRONIC BONE ABSCESS

The chronic bone abscess at the diaphyseal extremity in the patient whose epiphysis has not yet fused is revealed on the radiograph by an area of cancellous destruction extending from the epiphyseal growth cartilage towards the medulla Its boundaries are not sharply defined but they are perhaps rendered more apparent because the adjacent bone has an increased density Frequently the lesion is spatulate in form and even with five years history may be less than a quarter of an inch in thickness but extending an inch or more from the epiphyseal line towards the medulla The more acute the abscess the larger the cavity formed and the less defined are its boundaries and the greater the probability of new periosteal bone accretions As the lesion increases with age its boundary will tends to become more sharply defined and sclerosed In one patient aged 21 who gave a history of a lesion of seventeen years duration the radiograph showed an abscess with a sharply defined regular wall which was little more than a quarter of an inch in diameter extending from the subarticular surface of the tibia for one and a half inches towards the medulla (See Fig 3 Special Plate) In patients above 20 years of age who give a history suggesting the beginning of an abscess about the age of 14 the radiographs may show the abscess to be about an inch above the ossified epiphyseal growth cartilage

It is rare for the growth cartilage to be penetrated by staphylococcal infection and the epiphysis eroded consequently though the joint may exhibit periodic effusion it is rare for it to be infected by extension but after the epiphysis has fused the lesion may be extended into the epiphyseal area and even infect the joint No evidence of accretion of new periosteal bone may be found even after the abscess has existed many years thus in one of seventeen years duration no thickening was apparent and consequently no swelling was detectable on clinical examination However in those cases in which the abscess has involved most of the diaphyseal extremity an accretion of new periosteal bone will be shown No sequestrum is to be observed within the abscess cavity except in those cases that have been subjected to surgical intervention as the abscess extends by the gradual absorption of the adjacent bone

Much less common than the abscess in the metaphyseal region is the abscess in the middle third of the shaft of a long bone and beneath the periosteum

MEDULLARY ABSCESSES

An abscess in the medulla of the middle third of the shaft of a long bone is recognized from its radiographic appearances The shaft in the area shows a spindle-shaped expansion or thickening In the middle of the

LEGENDS FOR RADIOGRAPHS IN SPECIAL PLATE

FIG 1—Radiograph of G J a youth aged 15 showing subacute abscess in lower end of diaphysis of tibia Duration of symptoms five months Note ill-defined area of central cancellous destruction with increased density of the adjacent bone and accretions of new periosteal bone A radiograph taken six years after evacuation of abscess showed linear outline of cavity in lower third of diaphysis but no evidence of reaction in the adjacent bone or periosteum Clinically cured

FIG 2—Radiograph of Mr D E aged 21 showing chronic abscess in lower third of tibia three-quarters of an inch above line of epiphyseal growth cartilage Note marked increase in density of surrounding bone Duration of symptoms five years

FIG 3—Radiograph of Mr S B aged 21 showing chronic abscess in lower end of tibia which has extended to subarticular bone the epiphyseal growth cartilage having disappeared Duration of intermittent symptoms seventeen years Note well-defined outline of sclerosed wall of abscess and absence of periosteal reaction

FIGS 4 and 5—Antero-posterior and lateral radiographs of Miss E M aged 14 showing chronic abscess in lower end of tibial diaphysis Duration of symptoms five years Note well-defined wall of abscess

FIG 6—Radiograph of Miss E M ten years after biopsy which failed to reveal abscess Compare with Figs 4 and 5 Note drill hole in bone (made ten years previous to this radiograph being taken) is away from site of abscess but resolution of the infected area has largely occurred

FIG 7—Radiograph of D C aged showing abscess involving the epiphysis Duration of symptoms one month Tuberculous

FIG 8—Radiograph of P P aged 6 showing tuberculous abscess which has involved the epiphysis Duration of symptoms several months Tuberculous

FIG 9—Radiograph of Miss E H aged 2- showing chronic abscess in femoral shaft Duration of symptoms fourteen months History of typhoid fever Typhoid bacillus removed from pus

expanded segment a well defined rounded or ovoid area of cancellous destruction—the abscess cavity—is seen. This area is surrounded by a thick wall of dense compact bone, which appears to obliterate the medullary cavity above and below the abscess cavity. Surrounding the thickened abscess wall evidence of activity is indicated by the thin regular layer of new bone that is being added beneath the periosteum. Following successful surgical evacuation of the abscess cavity the bone assumes its normal compact and cancellous proportions, the reactive periosteal bone being absorbed.

PERIOSTEAL ABSCESSES

When the lesion develops as a localized abscess there is present beneath the periosteum a localized fusiform thickening of the bone which is due to the laying down of additional subperiosteal compact bone in the thickest part of which a well defined rounded abscess cavity will be seen.

Radiographic Localization of the Abscess

In these days when lesions of bone can be accurately localized by radiography this should be done before any surgical intervention takes place, for, as already indicated, the abscess is usually but a narrow track that may easily escape the surgeon's weapons and thus permit the recording of one more radiographic fallacy. Two radiographs (Figs. 4 and 5, Special Plate) reveal such an abscess which eluded the surgeon's search. It is interesting, for it shows that while the abscess was not discovered by the trephine, the lesion resolved, though the scar of the trephine hole has persisted for over ten years (Fig. 6, Special Plate). Localization of the lesion followed by the marking of the skin indicating its site, would enable the surgeon infallibly to expose the lesion in the minimum of time.

Results of Surgery on Radiographic Appearances

Serial radiographs of the bone from which an abscess has been evacuated show that the cavity may persist for many years. One, two, or three years afterwards the walls of the cavity are not sharply defined and present a radiographic picture which has been mistaken for that of an active abscess. And as it is not uncommon for a patient to have occasional bouts of pain or discomfort, with undue redness of the area over the site of the old abscess, particularly if he has an injury to the part, it is imperative that this possibility be realized, otherwise an active abscess may be diagnosed and a useless operation be performed. At this operation no abscess will be found, and histological examination of material removed will indicate the reaction of trauma. A few days' rest results in disappearance of these clinical signs though the radiographic appearance remains. While little radiographic evidence of the abscess site may be found after two or three years, in some cases even after twenty years the walls of the cavity made by the surgeon may be observed. Such old scars in bone are clearly defined with linear contours, and present *no evidence of reaction* in the surrounding bone. After the effective evacuation of an abscess which was associated with definite accretions of new periosteal bone the latter is soon absorbed, and in a few months no trace of it can be found. This is an additional feature useful in the recognition of the evacuated abscess.

Differential Diagnosis

There is perhaps no lesion in which the clinical history of the patient is more helpful in diagnosis than the Brodie abscess, and in introducing the question of differential diagnosis I cannot do better than quote Brodie's own words. He asks:

> 'What are the circumstances that would lead you to suspect the existence of abscess in the tibia? The answer is: When the tibia is enlarged from a deposit of bone externally; when there is excessive pain, such as may be supposed to depend on extreme tension, the pain being aggravated at intervals and these symptoms continue and become still further aggravated, not yielding to medicines or other treatment that may be had recourse to, then you may reasonably suspect the existence of abscess in the centre of the bone.'

The clinical history will indicate the age of the lesion and the existence of any previous septic focus or infection likely to be associated with bone abscess. Such information is invaluable in view of the fact that lesions of a widely different significance produce radiographic appearances which are rather alike. Such lesions are tuberculous abscess, gumma, simple bone cyst, sarcoma, and endothelioma.

TUBERCULOUS ABSCESS

In this series of cases five of the six children under the age of 5 years who presented a lesion of the bone so intractable that radiographic investigation was sought had a tuberculous abscess which was associated with some typical lesion in another part of the body. The tuberculous abscess does present certain features which assist in identification. Mention has been made of the fact that the tuberculous process does not appear to be checked by the growth cartilage at the metaphysis and prevented from invading the epiphysis, as is the usual feature of the staphylococcal abscess (Plate, Figs. 7 and 8). The early tuberculous bone abscess is a regular rounded excavation with clearly defined walls, for the effect of the organism is the solution of the bone against which it comes into contact without any apparent reaction, such as osteoporosis or osteosclerosis in the adjacent healthy bony wall. After an interval of some months general decalcification of the involved bone occurs, and then an ill defined sequestrum of somewhat greater density than the neighbouring bone may be recognized.

GUMMA

Gumma of the bone is usually identified by the massive reaction it produces in the adjacent bone. This finding should indicate the need for obtaining the Wassermann reaction. Evidence of other syphilitic lesions may be forthcoming.

SIMPLE BONE CYSTS

The commonest sites for such lesions are in the neighbourhood of the great trochanter of the femur and the middle third of the shaft of the humerus and the lower third of the radial diaphysis. In these sites the bone is expanded. The expanded area is ovoid, cyst like, and devoid of cancellous trabeculae. Its boundary is but a thin wall of bone, which appears to be yielding to the pressure of its contents. There is usually no evidence of new periosteal bone, in fact, the thin bony wall may even appear to have been completely absorbed in one area. Spontaneous fracture through such a cyst is often the event which leads to radiography and to the discovery of the lesion.

OSTEOCLASTOMA

In the early stages of its development this tumour may present a radiographic appearance which rather resembles the chronic abscess. The discovery of such a tumour at this stage would be accidental for the signs and symptoms are negligible, radiography of a bone following trauma being the usual means of recognition. The clinical history will therefore be a most essential factor in identification.

SARCOMA

There is a type of sarcoma which starts in the medulla by destroying adjacent bone and producing an abscess like cavity that may or may not have reactive changes in the adjacent bony wall Its boundaries are not clearly defined as in the case of the simple bone cyst It may lead to spontaneous fracture and subsequent radiographic appearances may give the suspicion of a sequestrum within the abscess like cavity The short history and the paucity of clinical signs and symptoms associated with the radiographic features should arouse suspicions of the gravity of the lesion further radiographs after a week or so may reveal conclusive evidence of its nature Often the bone in the region of the fracture will now show periosteal spicular formation

ENDOTHELIAL MYELOMA

Endothelial myeloma of the bone occurs at about the same age periods as we find with chronic bone abscess Like bone abscess it may be associated with lesions in other parts of the skeleton It often shows intermittency of symptoms The clinical features however do not reveal the chronicity of the bone abscess the progress of the lesion is more rapid The radiographic features which bear some resemblance to those of chronic bone sepsis I have dealt with elsewhere Often a marked response to x radiation therapy is seen in endothelioma and this is of diagnostic significance Serial radiographic study of the lesion will usually suffice for identification

PARASITIC FOETUS SUCCESSFULLY REMOVED BY OPERATION *

BY

MAX GREENBERG F R C S Ed

Senior Surgeon Johannesburg Hospital

(WITH SPECIAL PLATE)

A male child born on April 6 1937 was admitted to the Transvaal Memorial Hospital for Children under my care on April 26 He was born normally in a right occipito anterior position there being no difficulty with the labour in spite of the child being the mother's first The period of gestation was normal

On examination an incompletely symmetrical conjoined twin was found attached to the epigastric area of the host by a fleshy pedicle and consisted of a right arm an abdomen lower limbs penis and scrotum The lower limbs were kept in a frog position astride the abdomen of the host the penis and scrotum being opposite the host's umbilicus (Figs A and B) On palpation a bony pelvis and sacrum could be made out but no vertebral column or ribs A rounded firm mass could be felt in the abdomen of the parasite and there was an imperforate anal dimple a heart beat could not be felt or heard and no movements were observed the parasite appearing devoid of sensation Both the host and the parasite passed urine at different times The host except for the attachment of the parasite was normal

Barium was given to the child by mouth and was observed under an x ray screen It was found to pass through the stomach and small and large bowels of the host but not in the parasite suggesting that even if there were bowel in the parasite there was no communication between the two

Four cubic centimetres of uroselectan B were later injected into a vein and radiographs were taken at frequent intervals for an hour The dye was easily visible in the parasite revealing a normally functioning kidney but it

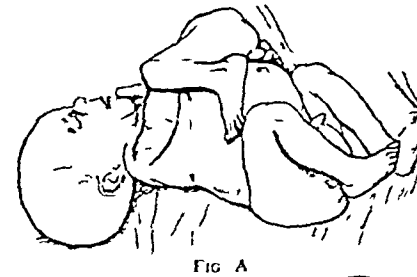

FIG A

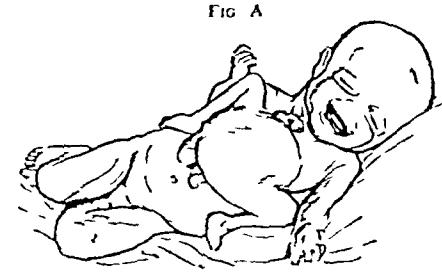

FIG B

Illustrations showing the relative positions of host and parasite (Redrawn from photographs by Audrey J Arnott)

was poorly shown in the host owing to there being a large quantity of intestinal gas but the secretory systems were present and the dye collected in the bladders of host and parasite

The host during the following two months was growing normally while the parasite remained stationary the ratio of host to parasite having risen from approximately 2½ to 1 at birth to 4 to 1 on June 15 The child continued making this progress till August 23 when surgical removal of the parasite was decided upon

The Operation

Under general anaesthesia an incision was made round the parasite through skin and subcutaneous tissue and it was then noticed that the peritoneal cavities of the host and parasite were continuous A loop of blind ending bowel from the parasite lay free in the host's part of the peritoneal cavity and a fibrous cord apparently a urachus joined both bladders The host's abdominal cavity contained its normal viscera but in the parasite's peritoneal cavity there was only a horse shoe kidney with two ureters entering a bladder

The peritoneum was cut close to the parasite leaving enough for the host's abdominal cavity the blind loop of bowel was returned to the parasite and the fibrous cord joining the two bladders was ligatured and cut near to the host's bladder The host's abdomen was then closed in layers The wound healed by first intention and the child was discharged from hospital on October 2 1937 The parasite is shown in Fig 1 of the Plate

On February 2 1938 the child was again seen being then in perfect health He had put on weight and there was no sign of ventral hernia having developed at the site of operation (Plate Fig 2)

Clinical Memoranda

Recurrent Cerebral Thrombosis with Recovery

The case of cerebral thrombosis of which I give some details strikes me as being rather unusual, if only because the patient has made such a complete recovery after each attack, and this in spite of her age and the alarming character at the time of some of her symptoms

CASE RECORD

A lady aged 69 became very depressed in February 1936 and strange in her manner following an accident to her daughter whereby the latter lost an eye Her relatives stated that she had become very confused and no longer took any interest in either her personal cleanliness or her clothes whereas before she had always been most particular in this respect At the same time her speech became indistinct and there was considerable muscular weakness so that she could hardly walk Her pulse was slow (60) and soft and her blood pressure 120/60 The heart sounds were muffled The pupils were small and contracted and barely reacted to light the knee jerks could not be elicited There were no other physical signs and the Wassermann reaction was negative Complete recovery followed within a month

After a period of perfect health a similar attack occurred in May of 1937 but was marked by periods of coma alternating with spells of motor activity when the arms were slowly and mechanically raised and dropped, to give rise later to considerable general restlessness Insomnia was a feature of this attack Complete recovery followed within a month

On December 23, 1937, she again became strange in her manner her expression was vacant and she had difficulty in recognizing those around her By December 27 she had lapsed into a deep coma A catheter specimen of urine showed albumin + and sugar *nil* There was incontinence of urine and faeces The arms were flaccid but not completely paralysed By the evening of December 28 as her condition showed no improvement I gave a hypodermic injection of *digitaline grain 1/100* with strychnine grain 1/60, this was followed by a marked improvement within half an hour so that she opened her eyes and responded to questions with a considerable degree of intelligence These injections were continued thrice daily for the next two days by the end of which time the patient was talking and answering questions almost normally

Unfortunately a profuse and foul diarrhoea now set in and rapidly dehydrated the patient, the eyes became sunken the face thin, and what was more alarming she rapidly became stuporous and sank in a heap off her pillows, and presented all the signs of rapidly approaching death Added to this a gangrenous patch 2 in long by 1 in wide had developed at the upper end of the natal cleft Kaylene in one drachm doses in a little water or milk was tried and retained This was increased to a dessertspoonful every three or four hours on the following day, and met with a quick response The stools lost their frequency and their abnormal character and the patient started to take her food once again and show every sign of a return to health

The sloughing tissue on the buttock was irrigated with eusol three times daily and soon separated leaving a deep but healthy looking wound, which gradually but completely granulated up with the aid of lotio rubra

The patient has now made a complete recovery

SUMMARY

An elderly lady with a somewhat low blood pressure and slow pulse develops cerebral thrombosis as the result of severe mental trauma Symptoms suggest a lesion of the frontal lobes in the first attack as evidenced by a change in character and behaviour This postulates a thrombosis of the anterior cerebral artery The second attack was marked mainly by motor activity the up and down movements of the arms and the general restlessness suggest lesions at sites different from the first attack, and in the area supplied by the middle cerebral artery The third attack, more serious than the first two, suggests a more complete thrombosis of the middle cerebral artery, as shown by the flaccidity of the arms and the loss of control of the sphincters

The use of the old and well tried drugs digitaline and strychnine based on the pathology of the condition, was amply justified by the astonishing response The value of kaylene in acute infective conditions of the bowel is also well worthy of mention

Orthoptic Cure of an External Squint of 35 Degrees in a Woman of Thirty

I think that an account of the cure of this case should convince sceptics that there must be something in orthoptics and perhaps also raise hope in the hearts of adult squinters who would give much to have a pair of straight eyes, like the majority of their fellow beings

This woman had had a bad squint in her left eye from early childhood but there were points in her favour (1) it was an external squint, (2) she was a woman and had therefore a stronger desire to be cured than most men have—her mirror was her constant ally The vision in the right eye, with

$$\frac{-0\,5}{-3\,0 \quad \text{ax } 145}$$

correction was 6/9, and in the left eye, with

$$\frac{-0\,5}{-2\,5 \quad \text{ax } 30}$$

correction was 6/6, but of course only the right eye was being used

The angle of the squint was 35 degrees and when using a separator with a coin in front of the good eye she could just see a bright light held in front of the other but not a non luminous object such as a piece of white paper—that is vision was entirely uniocular

She came to see me twice a week and practised at home about three quarters of an hour daily with great regularity Within ten weeks the eyes were straight but *only while* she remembered ! In four months the acquirement of stereoscopic vision and the great increase in *brightness* consequent on the use of both eyes had made temporary relapses into uniocular vision so distasteful that no further exercises were needed to keep her eyes straight

The stages of her training were as follows (1) The acquirement of vision with both eyes simultaneously This was done with Remy's separator and Cantonnet's mirror stereoscope

(2) The transition from simultaneous vision to *binocular* vision—when for the first time in her life while using *both* eyes, she saw an object in space as one *This* was achieved by means of exercises with Cantonnet's stereoscope the large diploscope, and the small diploscope, together with Javal's grid for reading

(3) Lastly, stereoscopic vision had to be acquired For this purpose she went through a course of Swan Cole orthograms, using the ordinary Holmes stereoscope The whole training was completed by a study of anaglyphs by Dr Margaret Dobson

The enormous superiority of this orthoptic cure over a surgical cure, if indeed such had been possible, is obvious when one remembers that a surgical cure would have been merely cosmetic The originally deviated eye would have remained a non-seeing eye, and the great incentive to retaining a pair of straight eyes—namely, stereoscopic vision—would have been absent

Reviews

DIETETIC MALNUTRITION IN THE TROPICS

Tropical Nutrition and Dietetics By Lucius Nicholls M D (Pp 165 49 tables 2 plates 7s 6d net) London Bailliere Tindall and Cox 1938

In his preface to *A Treatise of Foods* published in 1704 Louis Lemert remarks that Several Authors have treated of this Subject but some of them have been so large and prolix that there is no Reader though never so much bent upon it but must be dashed in considering only the length of the Work Others have handled it with so much brevity and briefness that you can scarce meet with half the Things there which ought to be in The same might be said of a number of authors who have treated of this subject within recent years but not of Dr Lucius Nicholls whose recently published book *Tropical Nutrition and Dietetics* gives a clear concise and practical account of the relation of foods to health and disease in the Tropics It is meant primarily for medical practitioners who work among the masses in these regions but those working elsewhere will find it worth their while to study it for experience gained in the Tropics of disease due to dietary deficiencies provides much that is instructive for doctors elsewhere Of the eleven chapters in the book six are devoted to an up to date account of the essential constituents of food —carbohydrates fats proteins minerals vitamins roughage —and the energy value of foods In regard to protein requirements it is pointed out that while there is a general acceptance among the nutritionists of Europe and America that the daily protein allowance should be 100 grammes this allowance is too high for tropical conditions The author is in agreement with Aykroyd that 65 grammes is sufficient for men and 55 for women additional allowances being made for growing children and lactating women The weight of fat in the diet should be about the same as the weight of proteins Three chapters on dietary surveys analyses of foodstuffs and the prescribing of diets will be found most useful

The chief interest of the book lies in the account it gives of the symptoms and signs of dietary deficiencies In addition to the extreme conditions such as beriberi scurvy pellagra and keratomalacia which arise from various food deficiencies the study of the less cogent results of dietary deficiencies has brought to light the prevalence of many signs symptoms stunted growth and other effects These are dry and staring hair phrynoderma pellagra like eruptions scrotal dermatitis petechial haemorrhages oedema stomatitis sore tongue marginal stomatitis oesophagitis spongy gums Bitot's spots night blindness xerophthalmia dental decay malocclusion and irregularities of the teeth signs of rickets neuritis pareses anaemias lowered resistance to infection particularly of the lungs and intestines, and poor growth and condition of the body No doubt future study will reveal others For if Foods contribute so necessarily to the preservation of Life and Health they also produce the greatest part of the Distempers to which we are subject and so the knowledge we ought to be most desirous of should be that of Foods (Lemert 1704) Dr Nicholls's book provides this knowledge showing why it is that foods contribute so necessarily to health and how it is that improperly constituted food produces many distempers His object—to give as shortly as possible the general principles of nutrition and dietetics and to collect under one cover the salient points of this information —has been well achieved If there be a fault to find in the book it is in its title Tropical Nutrition Can nutrition a function of the body be spoken of as tropical per taining to characteristic of or peculiar to the Tropics?

TUMOURS IN THE NECK

Surgical Pathology of the Diseases of the Neck By Arthur E Hertzler M D (Pp 237 206 figures 21s net) Philadelphia London New York Montreal J B Lippincott Company 1938

The tumours which appear in the neck form a group of considerable surgical interest covering a very wide range of pathology There is indeed no region in which the appearance of a tumour is more common or in which its diagnosis may be more difficult The present volume dealing as it does with both the surgical and pathological characters of this group of tumours will be of interest to medical practitioners in many fields

The first chapters are devoted to Hodgkin's disease and the lymphosarcomas and an account is given from the surgical standpoint of the various views which pathologists have taken of these conditions This is followed by a discussion on the rare primary tumours of the neck and of thyroglossal and branchiogenetic cysts A description of the benign tumours of the neck follows Diseases of the salivary glands are treated in some detail and the volume concludes with a description of the secondary tumours and infectious conditions arising in the neck

The whole volume is beautifully illustrated both by photographs of typical cases and by microscopical sections The descriptions given are brief and to the point and while no attempt is made to go into elaborate pathological details the accounts given are sufficient for practical purposes The volume is indeed essentially practical and will well repay the study both of the student and of the surgeon who has to deal with these conditions

NUTRITION AND DIETETICS IN BRIEF

Food and Physical Fitness By Professor E W H Cruickshank M D D Sc M R C P (Pp 148 15 tables 2 figures 5 net postage 5d) Edinburgh E and S Livingstone 1938

Under the title of *Food and Physical Fitness* the Regius Professor of Physiology at Aberdeen has made available in the form of a short monograph a series of public lectures which he had delivered under the John Farquhar Thomson Bequest The book is a very good attempt to make available to the general public the results of research in nutrition and the elements of sane dietetics In his introduction Sir John Orr says that information of practical importance has been collected and presented in lucid and interesting language which can be understood by the general public and this is a very fair commentary The interest of the public is growing steadily in the subject of nutrition in relation to health and disease and to economic policy This book will be of great service to those engaged in social services and to householders who wish to make the best outlay of their budget on diet The general principles of the energy needs of the body and the value of the different foodstuffs for energy production and the sources of minerals and vitamins are very carefully dealt with

In the last few chapters Professor Cruickshank deals with subjects which are a good deal in the public eye at present—namely the relation of dental caries to defective diet and the effect of adequate nutrition on physique and muscular development In a somewhat trenchant chapter on vegetarianism he exposes the fallacies

of various modern diet fads These distortions of truth have undoubtedly arisen to fill the vacuum created by the fact that the public are increasingly aware of the importance of diet in relation to health, and yet the average doctor is either unable or unwilling to translate physiological principles into simple language which the lay public can understand Professor Cruickshank's book will go a long way to filling this vacuum by reasoned facts and it would be a great advantage if the book were read not only by the lay public but also by the medical profession

THERAPEUTICS OF ANTIMONY

Advances in the Therapeutics of Antimony By Professor Dr Phil Nat Hans Schmidt and Dr Med F M Peter With a preface by Philip Manson Bahr C M G D S O, M D F R C P (Pp 257 10 diagrams R M 18 bound M 19 50) Leipzig Georg Thieme 1938

This is an English version of *Ergebnisse und Fortschritte der Antimontherapie* by Professor Hans Schmidt and Dr F M Peter which was published early last year In our review of the German volume (*British Medical Journal* 1937 2 66) we mentioned the remarkable rapidity of the advance in the importance of the antimony compounds in the treatment of tropical diseases An English edition is therefore very welcome moreover, the authors have revised and expanded the original material and have incorporated the literature up to the end of 1937 They have also added an author index which is a very valuable addition Dr Philip Manson Bahr has contributed a preface, in which he reviews the extraordinary career of antimony as a therapeutic agent Jezebel used it to darken her eyebrows Paracelsus boomed it as a panacea and the University of Paris solemnly banned it and all its users In the first half of the nineteenth century it was the chief basis of the orthodox method of "heroic" treatment, while by the end of the nineteenth century it had almost ceased to be used Finally in the twentieth century it has made a sensational come-back, and organic antimonials are steadily increasing in importance in chemotherapy

GRINKER'S NEUROLOGY

Neurology By Roy R Grinker M D Second edition (Pp 999 406 figures 38s) London Baillière, Tindall and Cox 1937

The second edition of this work appears within four years and without any outstanding change in its scope, except that the descriptions of new developments, such as the increased knowledge of the physiology and pharmacology of the autonomic nervous system and advances in diagnostic methods such as the electro encephalogram and improved encephalography soon necessitated the shortening or omission of certain sections in the first edition if the aim of the author to keep the work within the covers of one volume was to be maintained In spite of this laudable aim the work is large and heavy, extending to nearly 1,000 pages, which only goes to show what a complicated subject neurology has become

The scope of the book is along the lines of the modern systematic textbook, the arrangement being largely on pathological lines and covering the field of organic neurology reasonably completely It is well illustrated, with a useful bibliography at the end of each section A good many textbooks of this kind are being published nowadays which cover much the same ground in much the same way, and it is a little doubtful how far their multiplication is worth while Probably each is patronized less on its individual merits than on the extent to which the author is known personally or by repute to those who happen to want a comprehensive manual of neurology at the moment The present volume will therefore appeal to the Chicago medical schools and those other schools which are under the influence of that important centre of learning but we see no particular reason to commend it to British readers to any greater extent than several other works of a similar nature

PRACTICAL ANATOMY

Manual of Practical Anatomy Volume I Upper Limb Lower Limb and Abdomen Volume II Thorax Head and Neck Central Nervous System Eye and Ear By J Ernest Frazer D Sc F R C S and Reginald H Robbins M A M D (Pp 536 and pp 456 281 figures and 290 figures 10s 6d each volume) London Baillière Tindall and Cox 1937

The *Manual of Practical Anatomy* by Frazer and Robbins of St Mary's Hospital, London, is something more than a guide to dissection and regional anatomy since the detailed description of the structure of the adult subject is explained and supplemented by references to developmental anatomy These not only add interest to the anatomical facts but throw a clear light on many details of anatomy which would otherwise be obscure Due attention has also been paid to the medical and surgical aspects of anatomy and we may specially mention in this respect the descriptions of the thoracic and abdominal regions

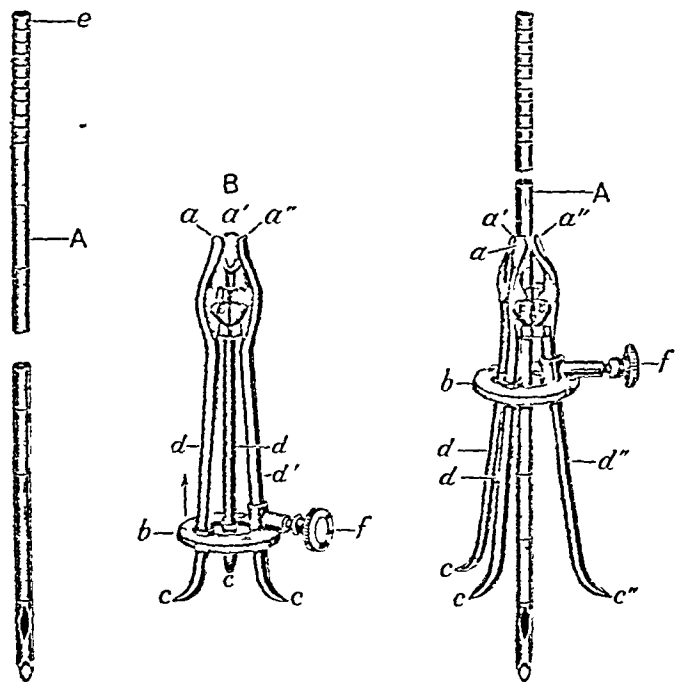
The book is in two volumes, but it is not burdened with too much detail, the full description of special structures such as the eye or ear being left for study in the larger systematic treatises on anatomy The nomenclature employed is the 'Birmingham Revision,' and each volume has a separate index and glossary The manual is on the whole well illustrated, many of the figures having been reproduced from standard works such as Hirschfield and Leveillé, others are new or have already appeared in Frazer's *Manual of Embryology* or in Buchanan's *Anatomy*, all of these have the unmistakable stamp of originality, and though some are schematic others are drawn from actual specimens and serve to illustrate particular points, such as the relation of articular cartilages pads of fat or synovial pouches to the ligaments of a joint The book, which is the work of two experienced anatomists, is admirably adapted to meet the requirement of both junior and advanced medical students, not only with regard to the anatomical information which it contains but also is a training of the faculties of observation and dissection and as an aid to the passing of examinations

Notes on Books

The first group of articles on the Management of Some Major Medical Disorders contributed to these columns were republished in March, 1936, as Volume I of *Treatment in General Practice* This collection dealt with diseases of the respiratory system, acute specific fevers and cardiovascular diseases In reviewing it Dr Robert Hutchison said that "the articles are so uniform in their mode of presentment that they might all have been the work of one author, whilst the therapeutic instructions given in them are clear and definite, and the reader is not confused, as he so often is in books on treatment, by the mention of lists of remedies which are 'sometimes successful'" The book was reprinted in March, 1937 and now a second edition, revised by the several authors, is published by Messrs H K Lewis and Co at 8s 6d

For a generation and more Hawk's *Practical Physiological Chemistry* has been an outstanding work and successive editions reaching now to the eleventh (J and A Churchill 30s) have kept well abreast of the very rapid developments of the subject In his great undertaking Professor PHILIP HAWK has of recent years enlisted the help of more collaborators and three other well known names now appear on the title page and various contributors have lent their expert knowledge and advice in different parts The book is and always has been the complete laboratory guide stocked with methods so carefully selected that they may be relied upon with absolute confidence In places a point of detail may be lacking but only where the original literature is quoted for fuller reference

The monograph by Dr ERICH A HEIDE on *Die Bornholmer Krankheit* (Berlin R Schoetz, RM 3) otherwise known as myalgia acute epidemica of Sylvest consists of a critical review of the literature including the articles which have appeared in the *British Medical Journal* by Pickles (1933 2 817) Carter (1933 2 56) Jay (1934 1 79) Buchanan (1934 1 120) and Scott (1936 2 698) The clinical aspects aetiology epidemiology and distribution of the Bornholm disease in Germany and other countries are discussed at length and the author comes to the following conclusions This disease represents one of the mysterious short lived febrile maladies of temperate zones on which new light may be shed by further epidemiological and parasitological investigations as has recently been exemplified by tularaemia Japanese river fever Weil's disease and tropical and subtropical typhus It is probable that the Bornholm disease is caused by some kind of living virus which is kept in an animal reservoir and transmitted by blood sucking insects at definite seasons of the year The question further arises as to the existence of endemic epidemic or pandemic diseases which are transmitted not by a specific agent but by telluric and cosmic influences which so affect man animals or plants that they develop a disease just as if they had been attacked by a living virus The author suggests that the Bornholm disease may be an example of this kind



The *Internationale Zeitschrift fur Psychoanalyse* and the journal *Imago* the official organ of the International Psychoanalytic Society both edited by Professor Freud have ceased publication The *International Journal of Individual Psychology* will also cease publication

Preparations and Appliances

TRIPOD FOR VENTRICULOGRAPHIC NEEDLES

Dr V OPIE (London W 1) writes

It is often difficult to keep steady the ventriculographic needle during the repeated aspirations of cerebrospinal fluid and injections of air in ventriculography Even a slight shifting of the point of the needle may stop the flow of the fluid The device depicted above helps to steady the needle and to keep it in the correct position after it has penetrated into the ventricular cavity It consists of a tripod which is slipped over the needle as soon as the cerebrospinal fluid begins to flow The pointed ends of the slightly curved legs of the tripod bury themselves in the diploe of the trephine opening while the blades at the opposite end of the legs grip the needle firmly and thus prevent it from being pushed in or out during the subsequent manipulation The tripod is manufactured by Messrs Lewis Bros 68 High Street Marylebone W 1

A ventriculographic needle 17 cm long once in the correct position in the brain it is fixed by means of the tripod (B) which is made to slip over the needle *a a a"* Short blades for gripping the needle *b* Movable ring When it moves upwards in the direction of the arrow the legs (*d d d"*) of the tripod spread out and the points (*c c c"*) bury themselves in the diploe of the trephine opening Simultaneously the blades (*a a a"*) are brought closer together and grip the needle which is thus immobilized The set screw (*f*) prevents the ring from sliding after it has been brought into the correct position The needle (A) is then connected to a syringe by means of a short rubber tube which is slipped over the free end of the needle (Actual size)

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY JULY 16 1938

CLINICAL SCIENCE

To all who were privileged to enjoy Victor Horsley's friendship, and especially those who were so fortunate as to work with him as collaborators or disciples and were thus able to savour the scientific genius as well as the courageous and lovable personality of this great Englishman, the very title "Victor Horsley Memorial Lecture" will bring a flood of happy recollections—perhaps most of all to those who were with him in that last and noblest chapter of his life written in Egypt and Mesopotamia and concerned with greater things than science We do well to commemorate such men primarily that we may not cease to learn from them those lessons of moral courage intellectual integrity, and scientific imagination that their lives show forth but also and particularly in this instance and at this time because Horsley exemplified that successful combination of clinician and scientific investigator the very possibility of which has recently been challenged by a distinguished laboratory scientist So wide was the range of Horsley's scientific interests that in a single lecture but one aspect of it can be adequately considered and Dr Gordon Holmes has chosen his contributions to the physiology of ocular movements as the theme of the present lecture He has developed this in a manner reminiscent of Horsley's own method, for he has presented a body of precise observations and has proceeded to provide an analysis of them on physiological principles

The cerebral integration of the ocular movements is a peculiarly complex problem in the physiology of movement, and this perhaps because of the abundance of facts of observation rather than from any lack of them In some ways it may at first sight seem that these movements are a law unto themselves Their cortical representation in the frontal lobe is anatomically separated from that of other movements, and the ocular responses to electrical stimulation of this representation differ qualitatively in some respects from the more familiar motor responses to stimulation of the so called "excitable motor cortex" Again, in many widespread disorders of movement and of posture from brain lesions eye movements alone escape disturbance, as, for example, in chorea double athetosis, and paralysis agitans, to cite but the most familiar To Hughlings Jackson we owe certain illuminating generalizations as to the modes of dissolution of function in disease of the central nervous system, and in the light of his conception of loss and release of function the phenomena of cerebral paralysis have been analysed on lines that are familiar to students of neurology

Jackson himself made many studies of disorders of ocular movement, but these disorders have never been brought fully within the scope of the principles which he showed to govern the evolution and form of disorders of movements other than those of the eyes It is the merit of Dr Gordon Holmes's lecture that he has so brought them, and has demonstrated that a careful study of disorders of ocular movements from cerebral lesions reveals those same phenomena of loss and of release of function with which we are familiar in respect of other movements Thus the exaggeration of the fixation reflex which may be found in association with certain forms of loss of voluntary deviation of the eyes is seen to be a release phenomenon comparable with the hyper tonus and other increased postural reflex reactions that are so prominent a feature of what we call spastic paralysis Conversely, there are described the disorders of voluntary movement and posture of the eyes that result from a defect of the fixation reflex, and this reflex itself is also subjected to close physiological analysis In a word Dr Holmes's studies have brought one more group of clinically observed disorders of function within the scope of those generalizations that have already proved so fruitful in neurology and while thus making these additions to our knowledge, he has also integrated them with the general body of neurological theory This is the true scientific method, and that it can still be pursued by simple clinical observation must be a cheering sign to those who believe that this method has yet a rich harvest to give to medical science and that it has not yet yielded pride of place to the experimental method These studies also teach us that whatever help we may receive in the advancement of medical science from the labours of the experimental physiologist it must always be the clinician who places the coping-stones upon these labours by determining their application as only he can to the human subject

The English school of neurology has a great tradition and we may learn from the studies which form the subject of this lecture that this tradition is still alive and honoured

A PIONEER HOSPITALS CENTRE

At page 138 we publish an account of the Birmingham Hospitals Centre and the Medical School Buildings of the University of Birmingham opened on Thursday by the Duke of Gloucester acting in place of the King who was prevented by indisposition from fulfilling the engagement This ceremony is an outstanding event not only in the annals of a city famous for its progressive spirit and local pride but also in the history of voluntary hospital planning in this country The Hospitals Centre —which means a hospital or group of hospitals linked structurally and in a working arrangement with the Medical Faculty of the University—is well understood in the United States but the Birmingham achievement is a pioneer one in Great Britain The new buildings are a first instalment providing some 500 beds the completed hospital is planned to accommodate 740 It embodies the latest ideas and experience in design planning and administration The beds are to be organized in units of sixty each unit being complete in itself The first instalment of patients is deferred until the autumn To provide a complete organization working at full capacity will take some time especially in a hospital of modern design including all the many departments supplying the needs of a medical school

Fully to understand the idea behind the scheme for the Hospitals Centre it is necessary to go back a little Soon after the war it became apparent that there was an increasing deficiency of hospital beds in Birmingham having in view its growing population and perhaps its increasing 'hospital consciousness The two large general voluntary hospitals—the General founded in 1766 and Queen's in 1840 both of them teaching hospitals—began to consider the question of extension on their existing in town sites The General with its Jaffay branch has 536 beds and Queen's 324 The Hospitals Centre scheme was made possible by the amalgamation of these two hospitals for working purposes, under the name of the Birmingham United Hospital of which Lord Austin is chairman A joint committee was formed including representatives of both institutions and the ambitious plan of a Hospitals Centre right outside the city was determined As soon as the full complement of the 740 bed hospital is complete Queen's will close down Another ruling consideration which has led to the establishment of the Hospitals Centre is the need for closer co ordination with the Medical Faculty of the University Hitherto the Medical Faculty (with those of Arts and Law) has been housed in the buildings of Mason's College in the centre of the city It has been unable to follow the other faculties out to Edgbaston so long as the two teaching hospitals remained on their present sites As the Prince of Wales said when he laid the foundation stone of the hospital and cut the first sod of the medical school buildings in 1934 A working partnership between the hospital and the Medical Faculty of the University is now universally recognized as the most effective service that can be rendered to those in need of care and treatment

The most urgent need was for general medical and surgical beds but it is expected that in due course the various special hospitals—of which there are nine in Birmingham—now located in the centre of the city will migrate to the new site This must be in each case a rather complicated business in view of the disposal of properties but the special hospitals are already associated with the scheme and they will have the opportunity of working out with the Executive Board plans for their own development on the site while still preserving their identity In years to come there may be in the city only casualty clearing stations and with an adequate ambulance service all in patient and out patient provision will be concentrated at Edgbaston The site which the Birmingham Hospitals Centre owes to the munificence of the Cadburys is of 150 acres of which 100 acres are scheduled for hospital purposes and 50 for open space This is considered adequate for all hospital developments for at least half a century to come

PLANS FOR PLYMOUTH

Publication of this number of the *British Medical Journal* coincides with the opening of the business and political part of the 106th Annual Meeting of the British Medical Association, and in our next *Supplement* we expect to give a full report of the first two days proceedings in the Representative Body The Association has met only once before at Plymouth sixty seven years ago The meeting of 1871 in the Three Towns" (Devonport Stonehouse Plymouth) was regarded as one of the most enjoyable ever held and if the elaborate plans sketched in last week's *Supplement* are carried through in the traditional Plymouth way the same will be said of the meeting of 1938 No member of the British Medical Association has to be reminded that at Plymouth he treads historic soil It is moreover a locality which combines the charm of seascape and landscape with the varied animation of a great port and arsenal Indeed the programme of entertainments and relaxations in a beautiful setting is so full that there may be risk of pleasure standing in the way of duty

The seventeen Scientific Sections have arranged a good and many-sided programme for Wednesday Thursday, and Friday Three combined sessions will be held one to discuss sciatica another the prevention of puerperal sepsis and another rheumatoid arthritis The main subjects taken by the Section of Medicine are toxic infective jaundice anxiety states and organotherapy, and by Surgery, the treatment of acute appendicitis, cancer of the breast and the septic hand The Section of Obstetrics, when meeting alone will discuss occipito posterior positions and their complications, Orthopaedics, fractures involving the knee-joint Neurology and Psychological Medicine, vertigo and the differentiation of states of depression Ophthalmology has what may be called a joint topic—co operation between ophthalmologist and physician in cases of visual loss, and Medical Sociology, not to be outdone, makes co operation in public health administration its chief item The Section of Public Health will discuss the future development of the hospital system Physical Medicine (meeting at Torquay on Friday), the basis of national fitness, and the Services Section the evacuation and treatment of gas casualties while Physiology stoops to conquer the practising doctor with a session devoted to light in relation to climate and health Pharmacology will debate the dosage of anaesthetics, the teaching of anaesthesia and ovarian therapy Pathology has chosen the aetiology of rheumatism and rheumatoid arthritis for discussion, Tuberculosis, the prevention of the disease with which it is concerned, and skiagraphy of the chest, Radiology x rays in the elucidation of haemoptysis, and the treatment of uterine haemorrhage—two matters of interest to other specialties The programme for Diseases of Children includes a debate on the modern failure of breast feeding, and another on empyema in early childhood, and on its second day a lecture in memory of the late Editor of this *Journal*, on Some Nutritional Problems of Childhood will be given before that Section by Professor L G Parsons, to whom the Dawson Williams Prize has lately been awarded Beyond these larger items in the Sectional plans for next week there are many independent papers covering a wide field of practice and research, all of them listed in the programme published on July 9 It is to be hoped that the audiences in the Sections will be worthy of the fare provided

In 1871 it was held to be a matter for serious nsideration by members "whether it will not be sirable to subdue the otherwise naturally growing endency to allow the holiday-making to override the scientific and working objects of these annual meetings" Never before so the argument ran, had the British Medical Association covered so large a ground of public usefulness or influenced so strongly public opinion "The annual meetings offer the finest professional platform which exists for the propagation of opinions in the profession, the publication of researches, and the enunciation of facts The natural course of events would be therefore, that these meetings should continue to attract papers of more and more value, and it was the operation of this opinion, and the great increase in the scientific prestige of the Association, which necessitated recently the formation of a multiplicity of Sections The reaction from the years of sectional activity to those of continuous pleasure making requires to be checked" The visitors to Plymouth in 1871 had earned these prim words of rebuke by their neglect of work for play Some such warning may be needed even in 1938

THE STREPTOCOCCUS CARRIER PROBLEM

The new chemotherapy has so changed the outlook in the problem of puerperal sepsis that its other aspects are apt to be forgotten It is indeed interesting to speculate on the direction which prophylactic efforts might have taken during the past three years had so strikingly successful a treatment not monopolized attention The chief advance preceding this had been to identify the source of puerperal infection as usually the nose or throat of a contact with the case, and measures for detecting such carriers were coming to be regarded as an obligation on those responsible for the conduct of midwifery, at least in institutions Where do we stand now in this matter? It has been emphasized repeatedly that the possession of a powerful therapeutic weapon in sulphanilamide is no excuse for relaxing precautions or for neglecting other forms of treatment It must nevertheless influence a decision when the proper course of action is really in doubt, or when extreme measures in detecting and excluding carriers are impracticable Strictly speaking the whole personnel of a midwifery unit should be swabbed on entry and at intervals thereafter, and carriers of haemolytic streptococci proved to be of Group A should be excluded until free The rigid application of this rule would overwhelm existing bacteriological laboratories with an exceedingly tedious type of work and probably demand the establishment of others, and at the same time it would sometimes disorganize clinical work by requiring the banishment of essential personnel Nor will these extreme measures necessarily succeed for a member of the staff may acquire a streptococcal infection at any time, and an active tonsillitis or sinusitis is a far greater danger than the quiescent carrier Any efficient precautionary system will include prompt attention to any acute [illegible] of the upper air passages whether by way of relief from duty or of bacteriological investigation a great question is whether this form of precaution which also involve the clinical recognition of as tradition infection of the upper air passages and its

investigation is not preferible to a system of universal swabbing This attitude was supported in our correspondence columns some time ago and it is favoured by Lucy M Bruce and Phyllis Tewsley [1] who report in detail an extensive study of the carrier condition in connexion with a small outbreak of puerperal sepsis in Australia This investigation was somewhat hampered by the lack of facilities for the serological typing of streptococci and in attempt to classify them by determining their susceptibility to different strains of bacteriophage did not provide a satisfactory substitute for this method Nevertheless the results indicate clearly that whereas in the presence of spreading streptococcal infection persons with a normal upper respiratory tract may become carriers for a short period only those with clinically detectable abnormalities in this region tend to remain carriers irrespective of their environment The conclusion drawn is that a clinical examination of the nose and throat should precede the study of midwifery this is a common sense attitude which has much to commend it

THE PECKHAM HEALTH EXPERIMENT

An interesting meeting was held at Clothworkers Hall in the City of London on July 6 for the purpose of discussing the recently issued interim report of the work of the Peckham Health Centre This report entitled *Biologists in Search of Material* was reviewed in these pages on June 18 (p 1312) Sir Wyndham Deedes who opened the discussion said that five or six years ago the starting of such an enterprise as the Peckham Health Centre might well have been thought impossible but despite difficulties and prejudices Alpine if not Himalayan Dr Scott Williamson and Dr Innes Pearse the seeking biologists had surmounted them all *Too many experiments were undertaken by people who* had a perfectly clear idea of what they wanted but did not allow the data—the material—to have enough to say in the matter On the other hand the Peckham experimenters had no preconceived ideas they were content to await whatever results the interaction of the material and the environment was capable of bringing about The policy of wait and see in this connexion at least was not without its advantages A great deal of money was sometimes spent in social work but the people for whom the social services were designed were forgotten or at least not studied Great changes in social environment had taken place within the experience of the present generation Man had been taken largely from the village or small town into a vast society in which the individual was lost and few people had given scientific consideration to the sociological consequences of such change *One sentence in the interim* report had struck him People tell us that there is no real neighbourliness We have discovered that the conditions suitable for neighbourliness are not there How [illegible] e suitability or otherwise of the environment of the ordinary [illegible]ple made all the difference between happy and [illegible]trated lives Dr Scott Williamson said that the [illegible] e significance of the interim report lay in the word of Anthropological' Sir Wyndham Deedes had extolled the courage of the experimenters but courage and faith and biology all went together The most appalling fact to be deduced from the report was what could only be described as the devitalization of the people The Centre was dealing with a representative cross-section of the community not poverty stricken relatively well housed many of the people in safe employment and yet in spite of the fact that various diagnosable maladies had been dealt with and maladjustments corrected there had been no great rebound to health The devitalization was present in various degrees many of the people enjoyed a sense of well being (what our reviewer called well seeming) but the population was rather a surviving than a living one This was due to the heritage of environmental conditions in the lives of the young people Later work at the Centre subsequent to the period covered by the report had brought out the helpful fact that notwithstanding a people relatively devitalized the children by the application of appropriate scientific measures could attain normal physiological standards *This was a great encouragement to go* further and discover a scientific approach to the various problems by watching how men and women under conditions of relative freedom behaved and reacted to the facts presented to them in the simplest possible way The experiment therefore had much further ground to cover One lesson for our profession was well put by Dr Scott Williamson Medical practice of the future he said will have to take into account the fact that patients are not only sick persons but units in some form of social machinery and the approach to the people is not best made through the contacts rendered necessary by sickness but through community centres or some such form of organization In reply to a question he promised to offer some guidance to social workers and local authorities on the method of organizing *in their respective localities such centres* free from officialdom as Peckham

TAR-VIRUS CANCER

Reference has been made several times recently in this *Journal* to the hypothesis that all malignant tumours are initiated and maintained in activity by a living virus In order to explain the undoubted carcinogenic action of many chemical irritants in accordance with this hypothesis it is necessary to suppose that chemical action of this kind only serves to render cells susceptible to the virus One of the leading advocates of this view Peyton Rous briefly announced two years ago the startling results of an experiment which at first sight appear strongly to support it The Shope papilloma is an innocent tumour infectious and unquestionably due to a virus *which occurs naturally in the skin of* wild rabbits in some parts of America It is transmissible to domestic rabbits and in them sometimes undergoes malignant change especially in response to trauma the virus however becomes irrecoverable after malignancy is established Rous injected a suspension of this papilloma virus intravenously in rabbits whose ears had been tarred The tar used very rarely caused malignant change even after prolonged application the only result being the formation of indolent papillomas

[1] *Med J Austral* 1938 25 1 639

On the other hand, about three weeks after the intravenous injection of papilloma virus the tarred ears suddenly assumed great proliferative activity and multiple cancers appeared on them and grew rapidly Apparently two stimuli, each incapable in itself of causing malignant change, had co-operated to achieve this result with astonishing rapidity Peyton Rous and J G Kidd[1] have now at long last published a full description of this phenomenon Although this does not detract from its significance it is now made clear that the effect is by no means a constant one an exceptionally active virus suspension preferably obtained from a natural growth in a wild rabbit, appears to be necessary to secure it This paper also records in minute detail the effects of varying the technique in a number of ways and in so far as these other results can be interpreted they point to the conclusion that malignant change occurs only when active virus injected intravenously becomes "localized" in a previously tarred area C H Andrewes and his colleagues[2] have to some extent confirmed Rous's observation, using not papilloma virus but that of the Shope fibroma a similar but different innocent tumour of rabbits It will be interesting to see where this method of experiment ultimately leads It should not be difficult so to adapt it as possibly to gain evidence of the presence of a virus in purely malignant mammalian tumours Any such results would be of enormously greater significance than those hitherto obtained

SYMPTOMS OF CARDIAC STANDSTILL

Some patients with heart-block have spectacular attacks in which there is loss of consciousness and convulsions, associated with extreme bradycardia or cessation of the heart beat This syndrome the Stokes-Adams attack, is also associated, though more rarely with other disturbances of the cardiac mechanism that slow the circulation almost to a standstill In the attack as usually described convulsions and apnoea take place while the heart beat is very slow or arrested but P Formijne[3] describes five patients with apnoea or convulsions which occurred after more or less normal cardiac activity had been resumed Three had heart-block, one a syncopal attack of emotional origin, and one attacks of ventricular fibrillation or flutter In two of these cases graphic records of the heart beat and of respiration during the attacks show that apnoea began at an interval of a few seconds after the return of the heart beat, convulsions or localized clonic movements were observed after about the same interval in three of the patients Cerebral anoxaemia, which is held responsible for the convulsions and apnoea accompanying cardiac standstill, will not account for these events as observed by Formijne, and he suggests that they are to the action on the brain of hyperventilated blood the latter contains a high concentration of oxygen and a low concentration of carbon dioxide, and results from the continuation of respiration while the circulation is arrested In experiments on narcotized dogs it was also demonstrated that apnoea and clonic contractions followed asystole when this was of 15 to 35 seconds' duration, analysis of blood taken from the carotid artery immediately after the return of the heart beat showed a reduced CO_2 content, and the blood was redder than normal arterial blood The apnoea could be prevented by the inhalation of 5 per cent CO in oxygen during the period of asystole The respiratory effects are believed to be due largely to chemical action on the respiratory centre, but some of the results indicated that the carotid sinus may also play a part Immediate treatment is rarely possible for a patient in a Stokes-Adams attack, but in the light of Formijne's work oxygen and CO_2 might be given with a view to preventing convulsions

MEASURING EMOTION

In this country and in the USA a wide interest is taken in the measurement of mental attitudes and emotional traits, not only on account of the importance of these assessments in social, educational, and medical questions but also on account of their uses in industry In spite of this there has existed hitherto no collected account of the literature on this wide subject To help to fill this gap Dr P E Vernon has undertaken a descriptive survey of experimental work which has been carried out on the measurement of emotional characteristics His survey which has been issued by the Industrial Health Research Board of the Medical Research Council,[1] is restricted to an account of types of verbal behaviour which are susceptible to quantitative treatment The techniques which have been invented for collecting groups of opinions are fully described and adroitly criticized by Dr Vernon In discussing the procedure of rating he points out that in relation to the marking of examination questions both the average mark and the dispersion of marks given by each examiner are liable to scandalous variations which could be and should be adjusted When due care is exercised in technique of experiments striking results are sometimes obtained It is possible to measure the relative effects of various types of propaganda by examining people before and after they have been subjected to the influence of a cinematograph film Of the specific tests quoted, one of the most ingenious is Watson's test of fair-mindedness The person under examination is presented with a statement, such as "all most, many, few, no Roman Catholics are superstitious" The subject who encircles either "all" or "no" is deemed to show prejudice in his response There are also ways of detecting prejudice in the examiner If, for instance a rater regards a subject as highly artistic he will tend to attribute all the other traits commonly associated with the artistic temperament to this subject if the rater thinks the subject melancholy he will fail to notice such of his characteristics as do not fit in with the preconceived

[1] *The Assessment of Psychological Qualities by Verbal Methods* By P E Vernon, Ph D Med Res Counc Industr Hlth Res Bd Rep No 83 London H M Stationery Office 1938

over simplified notion This phenomenon known as the halo effect usually due to the raters general liking or disliking for the subject is almost unavoidable It gives rise to suspiciously high correlations between pairs of traits in the estimation of character Following the lines originally laid down by Spearman in the analysis of special mental abilities many investigators have attempted to analyse the results of questionaries self ratings and vocational tests in terms of specific factors For example the degree of extroversion and introversion in a given subject has been thought to be separable into five component factors—namely sociability emotional maturity masculinity freedom from care and intellectual interest Dr Vernon points out that it is now generally admitted that an infinite number of factorizations of the same set of variables is possible but he expresses the hope that factorization may yet help us to make predictions with a maximum degree of efficiency Not all who read the survey may be as sanguine as this Dr Vernon however is to be congratulated upon a painstaking and extremely lucid summary of existing knowledge in this very obscure but fascinating field

IMMUNIZATION AGAINST POLIOMYELITIS

Constant attempts are being made in the United States to devise a means of protecting against poliomyelitis It will be remembered that one of these—the injection of a living and supposedly attenuated virus vaccine—led to disastrous results the active virus having undoubtedly caused attacks of the disease some of which were fatal More recently attention has been concentrated on rendering the nasal mucosa impermeable to the virus by repeated spraying with astringents a laborious proceeding which if carried out with persistence can scarcely be supposed to leave the nose quite as it found it A new possibility which will not however be translated to the clinical field without much courage and care is foreshadowed in experimental results reported by S D Kramer L H Grossman and G C Parker[1] These indicate for the first time that it is possible to immunize monkeys by the nasal route Natural infection by this route in man is usually overcome without involvement of the nervous system and it is thus that the majority of adults have acquired immunity The monkey reacts differently to the intranasal instillation of virus which either produces poliomyelitis or leaves the animal as susceptible as before What the present experiments show is that if the virus is introduced into the nose of monkeys after the repeated instillation of pituitrin and adrephine (a mixture of adrenaline and ephedrine sulphate) the disease fails to develop and a resistance to infection is usually produced indicated both by negative results from instilling virus alone at a later stage and by the demonstration of protective antibody in the animal's serum some animals also became resistant to intracerebral inoculation It is not clear why these drugs were chosen or how they act their antiseptic power is slight and the fact that the action is local is indicated by failure of protection when they are injected elsewhere They elicit a cellular response in the mucosa in which eosinophils are prominent The practical outcome of these observations remains for the present quite uncertain but they at least suggest that there is no need for a defeatist attitude in this difficult field

A SETBACK TO MEDICO LEGAL SCIENCE

In April 1935 the then Home Secretary Sir John Gilmour appointed an Advisory Committee on the Scientific Investigation of Crime Its members were Lord Trenchard (chairman) Lord Atkin (vice chairman) Lord Dawson of Penn Sir Russell Scott the late Sir Edwin Deller Sir Bernard Spilsbury Sir Frank Smith Sir Robert Robertson Mr Hugh Lett Sir Frederick Menzies and Sir Arthur MacNalty This expert committee unanimously reported in July 1936 in favour of the establishment in the near future of a Medico legal Institute[1] It declared that the scheme set out in the report was long overdue and should be pressed forward as a matter of public importance Reinforcing this view the Senate of the University of London gave unqualified approval to the general principle of creating a central institute for forensic medicine in the metropolis and associating it with a university chair The scheme provided for three separate but interrelated branches of activity—teaching routine work and research Such a national institute organically linked with the Faculty of Medicine of the University on the academic side and associated with the Metropolitan Police College laboratory at Hendon in its day to day work would as a matter of course become a centre for research in the medico legal sphere to which problems would be referred by outside bodies Two years have passed but nothing has been done Worse than that the Government pressed for a sign of its intentions now announces that it cannot at the moment consider a scheme which however admirable it may be would involve a not in considerable capital outlay The polite correspondence between Lord Trenchard pleading on behalf of the non official members of his committee and Sir Samuel Hoare the Home Secretary is reproduced at page 142 There is hardly a capital in Europe that does not possess a medico legal institute but England is still too poor and must await better times or persuade a "public-spirited benefactor" to put up the money

THE HALF-YEARLY INDEXES

The usual half-yearly indexes to the *Journal* and to the *Supplement* and *Epitome* have been prepared and will be ready shortly they will however not be issued with all copies of the *Journal* but only to those readers who ask for them Any member or subscriber who wishes to have one or all of the indexes can obtain what he wants post free by sending a postcard notifying his desire to the Finance Department British Medical Association House Tavistock Square W C 1 Those wishing to receive the indexes regularly as published should intimate this

SURGICAL PROCEDURES IN GENERAL PRACTICE

This is one of a series of articles contributed by invitation

FRACTURES OF THE SHAFT AND SUBCAPITAL REGION OF THE HUMERUS

BY

T. P. McMURRAY, M.B., M.Ch., F.R.C.S.Ed.

Any of the three types of violence—direct, indirect or muscular—may cause a fracture of the humerus at any level. Thus a direct blow on the arm may be followed by a fracture at the site of injury, or a fracture at any level may follow a fall upon the outstretched hand. Or, again, a fracture may result from excessive muscular strain, as in the tear fracture of the great tuberosity, in which this portion of the bone is pulled away from the head of the humerus. As a rule fractures towards either end of the shaft are caused by indirect violence, whereas those occurring towards the middle of the bone may be either of the direct or indirect type.

Fractures of the upper part of the shaft are classified into two main groups: (1) fractures of the anatomical neck, in which the lesion lies external to the articular surface of the head, usually passing through the substance of the tuberosities; (2) fractures of the surgical neck, in which the fracture line is placed below the level of the tuberosities.

FRACTURE OF ANATOMICAL NECK

This type of fracture is seen usually in the elderly patient as a result of indirect violence following a fall on the hand. The fragments are generally impacted, although non-impacted fractures are also seen.

Signs of the Impacted Fracture

In this, the more common type of fracture of the anatomical neck, the presence of impaction between the fragments may lead to great difficulty in diagnosis without the help of a good x-ray photograph. Following a fall on the outstretched hand the patient complains of some pain and tenderness in the region of the shoulder, with slight swelling in the injured area and a restricted range of voluntary movements. On passive rotation of the arm the shaft and head of the humerus move in one unbroken mass. On such clinical evidence a mistaken diagnosis of bruising of the shoulder may be given, and the patient be advised to massage the shoulder and to use the arm freely in order to prevent the formation of adhesions. Such a course of treatment, although based on a wrong diagnosis, is often successful, and the presence of the fracture may not be appreciated unless an x-ray examination is carried out at a later date. This fortunate result can only occur if the impaction remains firm, but if during the massage and active movements disimpaction occurs, then all the usual signs of fracture become apparent.

Treatment of the Impacted Type

As the patients are elderly disimpaction of the fracture correction of any deformity should be avoided, unless re is such severe malunion that the subsequent movements of the joint would be gravely restricted. As a rule the extent of the impaction is not equal over the whole line of the fracture, being deeper on the inner than on the outer aspect. It follows that some degree of deformity is present in almost every instance, but not to such a degree as to cause any serious limitation of the range of movement in the joint.

Treatment therefore should consist in the protection of the impaction until union is complete, when any restriction can be diminished by active use of the joint, assisted by gentle passive stretching. A firm triangular sling is applied to the limb, supporting the elbow and preventing the constant strain of gravity, which might cause disimpaction, the hand and wrist being left free for active movements. As an additional safeguard, when the patient is nervous the arm may be bandaged to the chest by a binder, after a firm pad of wool or felt is placed in the axilla. Fixation is maintained for two weeks, after which the patient is advised to use the arm and is encouraged by gentle massage of the whole of the shoulder girdle.

Signs of the Unimpacted Fracture

The signs present in a case of this type of fracture of the neck of the humerus are very similar to those of displacement of the upper epiphysis. In each the shaft of the humerus is displaced forwards and upwards in front of the small fragment, which can be felt under the tip of the acromion process. In each the arm is slightly shorter than the normal when measured from the acromion process to the external condyle, while the elbow on the affected side is carried behind the mid plane of the body.

Treatment

The treatment is based on the impossibility of controlling the small upper fragment, which, because of its muscle attachments, is rotated outwards and upwards. As a result of this rotation the rough upper end of the lower

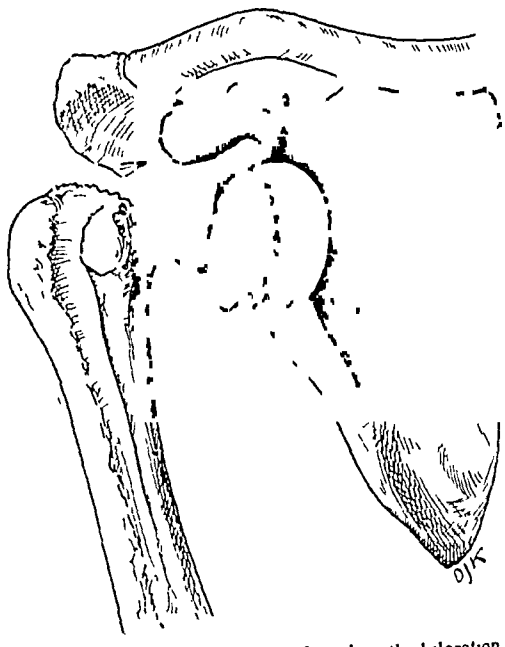

FIG. 1.—Fracture of the anatomical neck with dislocation of the head.

fragment lies against the articular surface of the head of the humerus which is separated from it by the capsule of the shoulder-joint. Approximation of the two broken surfaces is only possible by abduction and external rota

tion of the lower fragment Under anaesthesia the arm is pulled outward from the side into a position of abduction and external rotation when locking of the fragments can be felt The arm is then maintained in this corrected position for two weeks until consolidation of the fracture has begun when gentle movements may be started and the position of adduction gradually assumed Some little difficulty is met with in after treatment which may be prolonged

FRACTURE OF ANATOMICAL NECK WITH DISLOCATION OF HEAD

A rare but exceedingly troublesome complication of fracture of the anatomical neck of the humerus occurs when the upper capital fragment is dislocated from its position in the glenoid cavity (Fig 1)

Clinical Signs

With such an extensive injury there is great swelling pain ecchymosis, and tenderness round the region of the joint while the patient supports the injured limb with the other hand X ray photographs will demonstrate the lesion and indicate the new site of the head of the humerus

Treatment

Owing to the presence of a fracture through the neck of the humerus it is evident that reduction of the dislocated head into the glenoid cavity cannot be accomplished by any of the ordinary methods of rotation or by extension of the limb Its replacement however is possible by open operation—an extremely difficult procedure —or more simply by extension of the limb in the vertical direction

Reduction by Manipulation—Under full anaesthesia extension is applied to the limb in an almost vertical direction above the head Slow steady traction in this direction is continued until the dislocated upper fragment slips back into the glenoid cavity Occasionally during the extension of the arm assistance to the replacement can be given by the fingers which press the head gently into position through the skin of the axilla For success of the manœuvre reduction must be attempted within one week of the injury If a greater interval has elapsed reduction by this method is difficult or impossible After reduction the fracture is treated as already described The two raw surfaces are interlocked so that the limb may be brought down to a position of 50 degrees abduction at which redisplacement is improbable Later the range of movements is restored by active use

OLD FRACTURE DISLOCATION

When the displacement has been present for months or years the head of the humerus is usually united firmly to the side of the shaft The arm is held away from the side and movements between the humerus and the scapula are lost Reduction of the displacement is then impossible and the only indications for active treatment are the presence of signs of pressure on the nerves or vessels of the axilla or limitation of movement of the joint

Treatment

When the signs of pressure on the axillary contents are slight considerable improvement often follows a gentle manipulation of the shoulder under anaesthesia If however the signs of pressure are outstanding features such treatment is useless or even dangerous and relief is only possible by removal of the head of the humerus

The operation is a very extensive and difficult one with the possibility of injury to adherent vessels or nerves but if carried out slowly and carefully the result is satisfactory After removal of the head of the humerus the stability of the shoulder is definitely diminished Passive movements are free but stable active movements are negligible The operation does however succeed in its object of relieving the pain or swelling of which the patient complained and to that extent it is advisable

FRACTURE OF SURGICAL NECK

A fracture of the shaft of the bone occurring in the upper sixth and below the epiphyseal line is described as a fracture of the surgical neck It may follow on direct or indirect violence and unlike fracture of the anatomical neck usually occurs in vigorous adult life and is not as a rule impacted

Clinical Signs

In addition to the usual signs of fracture such as pain swelling ecchymosis and spasm of muscle the upper end of the shaft can be felt lying in front of the head forming a mass on the anterior aspect of the joint which rotates at the line of fracture without movement of the head

Treatment

If displacement of the fragments is not present treatment should consist in fixation For this purpose the wrist is slung from the neck by a halter the elbow being flexed to right angles the weight of the forearm acting as a steady extending force on the arm Lateral movements of the fractured surfaces are prevented by the use of three moulded metal splints which enclose the shoulder and arm down to but not including the elbow joint This protection is maintained for six weeks when the splints may be removed movements being restored by voluntary effort the range increasing with the diminution of tenderness in the fracture

When displacement is present reduction under full anaesthesia is simple by the application of steady traction to the limb in slight abduction Locking of the fragments can be appreciated and redisplacement is unlikely as the fractured surfaces are usually more or less transverse at this level When the reduction is satisfactory the arm can generally be adducted without risk of redisplacement fixation with three metal splints forming an adequate protection and preventing any recurrence of deformity

FRACTURE OF GREAT TUBEROSITY

Owing to its protected position under the muscular mass of the shoulder joint fracture of the great tuberosity is not as a rule caused by direct injuries to this region but follows overaction of the abductor and rotator muscles which are inserted here The fracture is usually present as a single lesion but it may be accompanied by dislocation of the head of the humerus

Signs

The diagnosis rests on the radiographic appearance and in the absence of a dislocation little can be elicited clinically beyond the presence of swelling and tenderness under the acromion with pain on passive movements of the arm When dislocation is also present this lesion may overshadow the comparatively small fracture and considerable disability results from the treatment of the injury as a simple dislocation without recognizing the existence of the bony lesion

Treatment

As it is impossible to control the detached fragment and bring it into apposition with the body of the humerus, it is necessary that the rough surface of the humerus should be brought into contact with the broken tuberosity This is easily done by abduction and external rotation of the arm to an angle of 80 degrees In this position replacement is complete and if it is maintained for three weeks voluntary movements can be instituted and the normal range of movement restored

FRACTURE WITH DISLOCATION

Here the head of the humerus lies in the subcoracoid region from which it can be replaced in the glenoid cavity by rotation or by slow steady traction If the dislocation were the sole lesion after-treatment would consist in the fixation of the arm to the side until the torn capsule had healed

Rest in adduction which would be ideal in the treatment of a simple dislocation of the shoulder, produces a wide separation of the detached tuberosity It is therefore necessary to rest the arm on a frame in a position of 50 degrees abduction for at least two weeks, when the angle of abduction can be increased to 75 degrees, at which the arm is maintained for a further period of two weeks before the resumption of voluntary movements

FRACTURES OF SHAFT OF HUMERUS

In considering the treatment of fractures of the shaft of the humerus, whether transverse, oblique, or spiral, one is apt to think of fractures of the femur In each there is a single bone, a fracture of which leads to shortening of the limb with overlapping of the two fragments Although the conditions are similar up to this point, the analogy cannot be followed any further In fractures of the femur the shortening is maintained by the protective spasm of muscles which are powerful enough to support body weight, whereas in the case of a fractured humerus the resistance to reduction is much less

In fractures of the humerus extension with weights, pulleys, or elastic is never necessary Full length of the arm and correct alignment can be obtained by using the weight of the forearm as an extending force The use of greater weight than this is not only inadvisable but in some cases positively dangerous Non union is reported as a common sequel of fracture of the shaft of the humerus by the same surgeons who advocate strong extension as the means of reducing the displacement

Treatment

The weight of the forearm is used by slinging the wrist from the neck by means of a halter, the elbow being kept at a right angle By this simple means the full length of the arm is obtained, but only if the lateral movements of the rough bony ends are prevented In most fractures of the humerus the line of fracture is not transverse, so that locking of the fragments is not usually possible There must therefore be a continuation of the action of the weight of the forearm if full length is to be maintained

The diagram (Fig 2) shows the simplest and most efficient method of producing both of these actions on the fractured bone The wrist is slung by a halter from the neck, while the broken humerus is protected by three

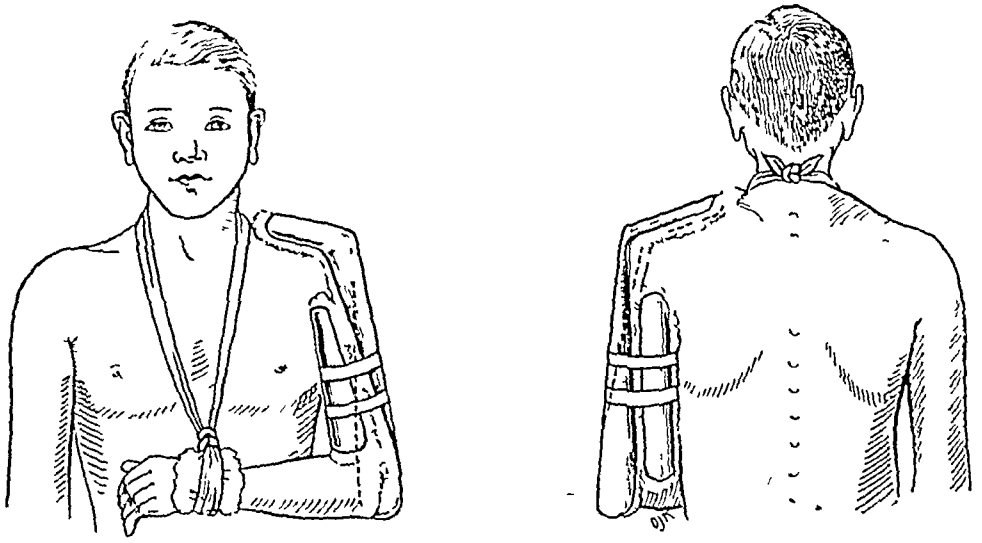

FIG 2—Front and back views of splinting for fractured shaft of the humerus

metal splints, surrounding the limb from the top of the shoulder to the level of the epicondyles In following such a method no triangular sling is used, as this would support and lift up the elbow-joint, thus destroying the extending force of gravity In the case of a man the shirt must not be tucked into the top of the pants, an arrangement which is similar in action to the use of the triangular sling The patient is encouraged to stand up or sit upright without any support under the elbow, and at night correction is continued by propping him up in the semi-erect position

If straight splints are used for the lateral protection of the bone, union with deformity will almost certainly result The reason for this is clear a straight splint applied on the outer aspect of the arm touches the bulk of the shoulder-joint and the external condyle of the humerus, leaving the middle of the bone unsupported unless this be pulled towards the splint into a position of deformity If, however, mouldable metal splints are used these can be twisted on their long axis so that they lie on top of the acromion, on the outer aspect of the shoulder joint, and towards the back of the bone at its lower end The small splints used on the inner and anterior aspect

are given a similar twist so that the bone is supported in its whole course and its normal alignment retained

Treatment is continued in this way for six weeks when as a rule the splints may be removed and the patient encouraged to use the arm for small active movements the sling usually being retained as a support for another three or four weeks Complete consolidation of the humerus is to be expected in nine or ten weeks and a full range of movement very soon after this Occasionally there is some restriction of movement in the shoulder a condition which may require a course of physiotherapy

COMPLICATIONS OF FRACTURED HUMERUS

Non Union

The occurrence of non union following a fracture of the humerus can be attributed to any of the usual causes such as want of fixation of the fractured bone want of apposition or the presence of pathological changes in the bone but in many instances non union is directly due to an error in treatment

There are two common causes of non union which are not sufficiently recognized (1) the widespread removal of partially detached fragments of bone in a compound fracture (2) *the application of excessive traction to the fractured* bone producing wide separation between the fractured surfaces

Treatment—The treatment of non union depends largely on the length of time that has elapsed since the occurrence of the fracture When this period does not exceed five months union frequently follows the use of efficient treatment as for a recent fracture reinforced by the stimulation of passive venous congestion at the site of fracture The method is simple a thin rubber band is placed round the arm next the skin above the site of fracture before the splints are applied and each day this band is tightened for three periods of half an hour without interfering with the fixation of the splints The congestion must be of such a degree that the hand become swollen and bluish but not painful This method is continued for at least three months before deciding whether union will occur or not If however more than six months have elapsed bone grafting holds out the only hope of union and should be carried out without delay

Nerve Involvement

Any of the nerves in the arm may be involved at the time of the fracture or at a later date either through injury by the rough bone ends or through compression in callus or scar tissue The musculo spiral nerve on account of its position close to the bone is involved more often than either the median or the ulnar nerve

Signs—When the function of the musculo spiral nerve is lost all the muscles on the extensor aspect of the forearm lose their power of voluntary contraction with or without paralysis of all or part of the triceps according to the site of the lesion

Treatment—When the clinical examination indicates that such an injury is present the paralysed muscles must be protected from overstretching by placing the hand and fingers on a long curved splint the wrist being held in dorsiflexion with the metacarpophalangeal and interphalangeal joints in slight flexion Gentle massage is given to these protected muscles the progress of the nerve injury being gauged by repeated electrical examination of the paralysed muscles If from such examination it is evident that the nerve is torn an operation for nerve suture or nerve freeing should be carried out without delay Very occasionally when there has been wide preliminary destruction of nerve tissue as in a severe compound fracture it may be impossible to perform a satisfactory suture of the divided nerve and improvement in the function of the hand may only be possible by transplanting the tendons of some of the flexor muscles of the forearm to the dorsum so that they act as extensors rather than flexors of the wrist and fingers

Nova et Vetera

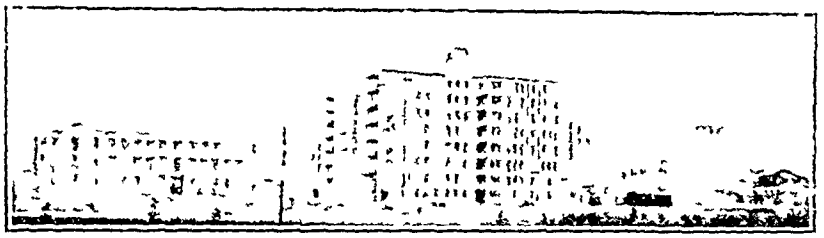
SURGICAL FORCEPS DOWN THE AGES

The History of the Forceps An Investigation upon the Origin Evolution and Use of the Forceps from Ancient Times to the Present Day (With a Chronology in Dates) By Vilhelm Moller Christensen (Pp 39 111 figures A Chronological Table 20 net) London Humphrey Milford Copenhagen Levin and Munksgaard 1937

Dr Vilhelm Moller Christensen says that he invented a pair of forceps when he was an assistant physician in Denmark in 1931 Curiosity led him to inquire into the history of forceps and like most people he thought there were only a few varieties Investigation soon showed him his mistake and he has since travelled far and read much to produce this book on their history and evolution

The result of his inquiries has been to show that forceps were in use long before the invention of scissors, and that they are found in Egypt and Mesopotamia about 3300 BC The different types evolved were employed for epilation for the removal of foreign bodies, and for dealing with the smoky wicks of the oil lamps then in common use The epilation forceps were used alike by men and women forming a part of their toilet sets Everyone seems to have carried such a set for there must have been many who preferred to pluck out their hairs with a pair of forceps rather than be shaved with a flint or bronze razor Two different types were developed the Cypriot and the Mycenaean about a thousand years later Dr Christensen thinks they were not known to the Egyptians but year later the Mycenaean type found its way to Italy and Scandinavia Thanks to the work of Dr J S Milne the surgical instrument of Greece and Rome are fairly well known Dr Christensen has consulted his book and is able to show from personal examination that a pair of bronze forceps in the Copenhagen Museum is more likely to have been used for drawing the stump of teeth than a epilation forceps as was stated by Dr Milne

Surgical forceps have not undergone any great change during the last 5000 years though it was a long time before the blade were ridged to improvement of which materially increased their gripping power It was longer still before they were provided with a ring or slot to keep them closed and make them self adherent When Dr Christensen was in England he visited the Guy's Museum and the Wellcome Medical Institute Of the twenty four pairs of forceps in the Guy's Museum (still there he thinks that seventeen are incorrectly described as to their use For one reason he did not see the example in the Internal collection of Instruments at the Royal College of Surgeons in Lincoln's Field where he would gladly have consulted Neither has he read the late Mr Allbutt's on the development of the eye me for Koberle Klein and Sydney Wells in the *British Medical Journal* in 1917 (I no mention at all of Spencer Wells



The book is very useful as a collection of medical history there a chronological table how many different types from prehistoric bibliography, and index of

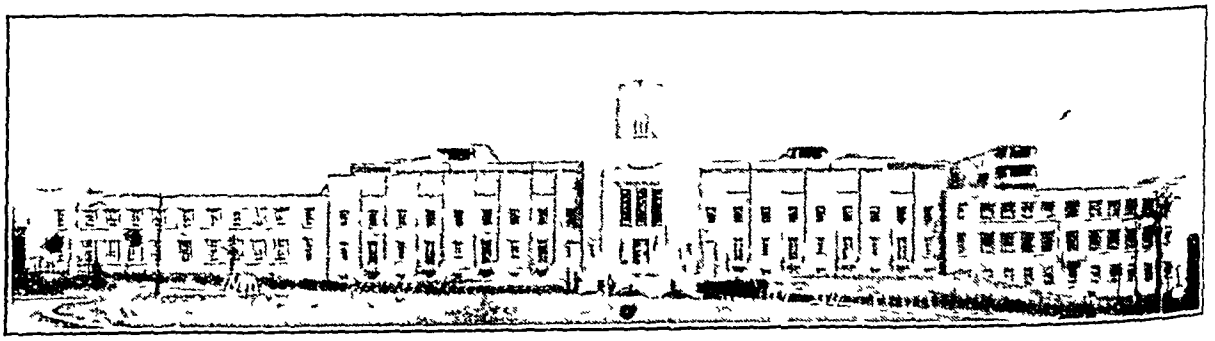
THE BIRMINGHAM HOSPITALS CENTRE

ROYAL OPENING CEREMONY

The opening of the Birmingham Hospitals Centre and the Medical School Buildings of the University by the Duke of Gloucester on July 14 sets the seal upon a great enterprise which was first mooted eighteen years ago

The new buildings at Edgbaston two miles from the centre of the city on open ground 500 feet above sea level and just to the north-west of the University, make an inspiring group even now, although the scheme is far from complete Nothing has been spent in useless adornment but the very simplicity of the treatment and the harmonious massing of the several buildings give it all the needful dignity The three main structures—the hospital itself the nurses home to the north and the medical school buildings to the south—fit in perfectly with one another so that the eye is satisfied from every aspect All the buildings are in a yellowish-grey stone, disappointing at first glance when compared with the warm red of the University a few hundred yards away, and yet not unpleasing On three sides of the hospital stone balconies have been constructed on every floor of the medical and surgical wings for the outdoor treatment of as many patients as possible, and these give a decorative relief to the plain wall surfaces

Side View of Hospital and Nurses Home



Evidently the scheme owes something in its architectural conception to the Medical Centre of New York City in which many hospitals and schools are associated, but there the emphasis is on the perpendicular line, whereas at Birmingham it is on the horizontal The hospital building is of seven and eight stories, as compared with the twenty-two stories of the Presbyterian Hospital, the original unit of the New York Centre The architects, who submitted the winning design in open competition, are Messrs Lanchester and Lodge of Bedford Square, London Mr H V Lanchester is the designer of the University of Leeds, the Cardiff municipal buildings, and the reconstruction of St Bartholomew's

The First Instalment

The buildings which have been opened this week are a first instalment Much remains to be added before the Centre corresponds fully with the architects' original plan The new hospital at present will provide just over 500 beds, whereas the completed hospital is planned to accommodate 740 The buildings so far finished and opened include the central administrative block, with offices, stores, and large central kitchens, dominated by the clock tower, which serves the utilitarian purpose of water storage The medical wing to the east of this block is also complete, as is the surgical block to the west with the exception of one of the forward projections There remain to be added, on the west side, a casualty department and ward and the large out patients' department, and, on the east, a paying patients' block of 100 beds, also to project from the centre of the building southwards the chapel Opposite the principal entrance to the hospital (north), on the other side of the fine roadway, is the nurses' home a large seven storied structure which when complete will have on the one side of it a smaller night wing and on the other a home for the hospital maids A dispensary is at present being built as a link between the surgical wing and the out patient department

The New Medical School

To the south of the hospital, at a lower elevation separated by a wide and pleasant court and garden space which will be used for convalescent patients, are the Medical School Buildings These are only two, or in some parts three, stories in height, so that they do not rob the hospital of any sunshine But the main frontage extends for a full 600 feet On either side of the entrance block is a square of buildings surrounding an open central court If these school buildings stood by themselves they would be regarded as a triumph of architecture, they are dwarfed however, by the great mass of the hospital behind them On one side are located the anatomy and physiology departments and on the other those of bacteriology and pathology, and the museum and library overlook the road leading to the University Three well equipped lecture theatres have been provided, and there are laboratories for each of the four principal sections The building was still in the workmen's hands on the occasion of our visit, but it was evident that teachers and students will enjoy every accommodation and facility Covered ways and corridors connect the medical school with the hospital

Medical School South Frontage with Hospital Clock Tower beyond

Internal Hospital Arrangements

The 500-bed hospital now opened although ultimately the bed accommodation will be increased to half as much again, is nevertheless complete with all auxiliary and ancillary services It embodies the latest ideas and experience in design, planning, and administration The beds are to be organized in units of sixty, each unit being complete in itself Of the sixty beds, thirty will be for men and thirty for women each thirty will be made up of one ward of sixteen beds two of four beds and three of two beds The largest ward in the hospital will be

have more than sixteen beds There will be six general operating theatres—one on the floor of each of the surgical units—as well as departments for massage and remedial exercises x rays and radium electrotherapy hydrotherapy and other special purposes The beds as far as possible are being arranged parallel to the windows instead of in the usual right angle position and the heads of the beds are against partition screens projecting into the ward some eight feet from the wall It is intended that each member of the senior staff shall be assigned one of the units of sixty beds with accessory services clinical laboratory record room and so forth When the completed hospital is functioning of the 740 beds 240 will be medical, 200 surgical 60 children's 60 gynæcological and obstetric 60 special (ear nose and throat ophthalmic dermatological) and 20 casualty In addition there will be the 100 beds in the paying patients block still to be constructed Fifty of these beds will be in single rooms This block will be so related to the hospital that all essential services may be obtained with the least inconvenience to the patients

The nurses home when the night wing is added will accommodate 460 nurses giving each of them a separate bedroom There will be separate bedrooms also in the maids home for 100 maids Part of the nurses home will be a training school with lecture theatre and demonstration rooms

It should be added that it is expected that it will be October or November before the Centre opens for the first instalment of patients The Birmingham United Hospital (the General Hospital and Queen's) is undertaking without avoidable delay the responsibility for the new buildings and service but the speed is necessarily regulated by rate of recruitment of nursing and domestic staff To provide an entirely new and complete organization to full capacity will take some time especially in a hospital of such modern design and containing all the numerous departments connected with the special needs of a medical school

The Finance of the Scheme

On the financial side the Centre, being a unified institution not one hospital appealing against others with competing claims has been fortunate in enlisting the enthusiastic support of the whole community The civic authorities headed by successive Lord Mayors since the appeal began in 1930 have been particularly co operative The cost of the scheme with the 740 bed hospital is one and a quarter millions one million of which represents the cost of the present first instalment That million to within the last £30 000 has been secured A few days before the opening the Lord Mayor received a letter from an anonymous well wisher promising £10 000 to cover certain additional items of expenditure if the outstanding £30 000 were forthcoming Thanks largely to the efforts of the secretary of the Centre Captain J E Stone whose writings on hospital administration are well known in the hospital world the appeal expenses represent just under 1 per cent One sixth of the amount of the appeal fund is credited to the University for the building of the school the maintenance of which is the University's responsibility no part of the expenditure falling upon the hospital authorities When the University, a few days before the opening marked the occasion by conferring certain honorary degrees, it was mentioned that Lord Nuffield who received the degree of Doctor of Law had been the chief contributor and next to him the largest single subscriber had been Mr Harry Vincent a Birmingham business man for eight years the honorary treasurer of the appeal and one of the hardest workers on its behalf

The words of Dr Robert Hutchison President of the Royal College of Physicians of London (who with Sir Cuthbert Wallace President of the Royal College of Surgeons of England and Sir Edward Mellanby Secretary of the Medical Research Council, also received honorary degrees), on the same occasion may be quoted

It [the idea of forming the Hospitals Centre] was an idea of great imagination carried out with all the practicality one expects in Birmingham and I am sure it will not fail not only to facilitate the treatment of the sick but also to improve the teaching of the student and extend the facilities for research It cannot fail to enhance still further the already high reputation of Birmingham as a teaching centre Those who practise in the metropolis with its woefully scattered medical resources view not only with satisfaction but with a considerable degree of envy Birmingham's Hospitals Centre I believe that the example you have set here to medicine in the concentration of medical resources in one quarter cannot fail to be widely followed in other cities

Opening by the Duke of Gloucester

The arrangements for the royal opening on Thursday of this week had to be revised owing to the illness of the King in whose place the Duke of Gloucester accompanied by the Duchess performed the ceremony The spaciousness of the setting permitted 8 000 people to be present It was arranged that the Duke and Duchess driving from New Street station should spend exactly one hour at the Centre first entering the Nurses Home where certain presentations were to be made by Sir Charles Grant Robertson chairman of the Executive Board of the Centre and Vice Chancellor of the University The list of presentations here included members and officials of the Board representatives of the architects engineers contractors and works staff the house governor and matron and members of the honorary medical staff of Birmingham United Hospital After the presentation of an address by the Lord Mayor Their Royal Highnesses proceeded to the main door of the administrative block opened with a key presented to the Duke by the architect and then passing through the vestibule visited one of the large general wards of sixteen beds and an operating theatre The further programme included an inspection of the buildings of the Medical School where the Chancellor of the University Viscount Cecil of Chelwood presented the Dean of the Faculty (Dr Stanley Barnes), the professors and other officers

NATIONAL FOOD POLICY

Within recent weeks two documents have been published which bring into prominence the imperative need for a national food policy planned not only to safeguard the *health of every citizen in times of peace but his existence* in times of war The first is a *Report on Nutrition*[1] issued by the British Association for Labour Legislation

It is an effort to carry out the instructions of the Assembly of the League of Nations and the International Labour Organization to the various nations of the world to study the problem in their own country It sets out clearly and concisely the relevant facts in regard to this problem as it exists in Great Britain An outstanding feature of the report and one that lends to it a high value is the emphasis laid on the relation of British agriculture to national health a relationship which is we consider fundamental to the whole health question

The second document is a special report entitled Towards a National Food Policy issued by the Committee against Malnutrition and recommended to public attention by a number of authorities on the subject of nutrition It emphasizes the need for adjustment of national economy towards the provision of an adequate guaranteed

[1] Obtainable from the Hon Secretary 55 St Mary's Mansions Paddington W 2 (Pp 118 price 1s 6d)
Bulletin No 27 July 1938 19c Eagle Street Holborn London W C 1

diet to all sections of the community It touches upon the range of possible measures that might be taken to this end, measures which the public—medical scientific and lay alike—is invited to examine and discuss The problem is a national one upon which the public as a whole must make up its mind

The relevant facts and suggestions, as set out in these documents, may be summarized under the following headings in order, as we think of importance food production food distribution cheapening of basic foodstuffs, the raising of incomes in certain classes of the community and palliatives

National Food Production*

The work of the scientific investigators of nutrition on the one hand and of public health officers on the other, has demonstrated that there exists among our population a large amount of indifferent health or actual disease and of predisposition to infection due to dietetic malnutrition, defects that can be obviated by the general adoption of a more balanced dietary which will include an increased consumption of materials—particularly fresh vegetables and dairy produce—which are normally products of our own agriculture Of these materials our own agriculture does not produce nearly enough for national needs although our conditions of soil and climate are particularly suited to their production This of itself suggests that some selection can be exercised in the national interest as to the crops that should be grown and the stock to be kept, provided always that the farmers are assured of an adequate return for their products

Secondly, agriculture has become an assisted industry, the aid from the State in the way of duties subsidies or other relief has been reckoned to be in the order of £40,000,000 It is then not unreasonable that the State should direct the incidence of this assistance so as to ensure the production of the materials essential to national welfare At present it does not do so Owing to the operation of subsidies much of the best land in England is being cropped with wheat and sugar beet, though it is so eminently suited to the growth of vegetables Wheat and sugar are among the cheapest products in the world's market, the easiest to transport and store Neither the everyday need for them nor the threat of war justifies the expenditure of such vast sums in subsidizing their home production As it is the nation consumes vastly more sugar than it needs If war emergency arises we are still under the necessity of importing the bulk of our food, and economy of shipping tonnage becomes the determining factor in what we can afford to import Wheat and sugar are of all foodstuffs the most concentrated and come from the Americas across the one sea that is likely to be open War emergency should be met in another fashion that of bringing into cultivation a great deal of the now neglected and unimproved grassland of England It would therefore be sound national policy to transfer the subsidies now being accorded to the growth of wheat and sugar to other branches of our agriculture, such as milk vegetables, and meat

Thirdly, the agriculture of this country is not flexible ugh Flexibility of farming demands the ability not y to produce a particular commodity of a particular ality at a given time, but also the ability at all times o utilize to the maximum of advantage, and with the minimum of waste, the urine and faeces of the grazing animal for the maintenance of soil fertility with the least possible risk of disease to the stock concerned Our arable area—and that is our only flexible area—contributes but 21 6 per cent to our land surface, rough and hill grazing thin which nothing could be less flexible contributes 32 1 per cent, and permanent grass, but little more flexible than hill grazing, contributes as much as 31 per cent The black patch—and it is the largest patch—is our huge area in permanent grass, and in easily improvable rough and hill grazing *no less than sixteen million acres in England and Wales* The cultivation of fruit, vegetables, and cereals is denied to a huge acreage of the country Permanent grass and rough grazings flow like a sea right up to the very doors of our highly populated industrial centres These great centres of population of necessity obtain their vegetables from considerable distances and hence the populace never, or hardly ever, eat vegetables that are fresh in the true meaning of the word Further, the fertility of this huge acreage cannot be properly maintained, nor can the health of the grazing animals Permanent grass has a short growing season and therefore, a short carotene-giving season The health of animals is probably, to a very real extent, a function of the length of the effective outdoor grazing season

In an emergency the prime need is calories and the greatest possible production of energy-providing food stuffs This necessity makes peremptory demands for a system of farming which is flexible It is only by a mass attack on our permanent pastures that we can adequately safeguard our supplies of health-giving foods and hope to meet an emergency in respect of calories If the country is so minded it can without further ado enormously increase the gross output of its food supplies add almost immeasurably to the health units contained in such output and permanently benefit British agriculture Moreover, this greater production meets another national requirement in that it involves a high rate of employment on the land The first essential, then, in any prudent national food policy is to adapt our agriculture to national needs These needs are clear their satisfaction is imperative, the neglect to satisfy them is the extremity of folly

Food Distribution

The protective foods the population needs are such as can be produced here to the permanent advantage of British agriculture But for large sections of the population their cost is prohibitive It is not the cost of their production but that of their distribution that stands in the way of cheapness to the consumer "The whole of our system of trading in these perishable goods—commission agents, salesmen, wholesale merchants, and retail traders—is out of date and is paying extravagantly for services rendered Much of it has grown up to accommodate the laziness, lack of forethought and real economy in the people themselves, there are no 'robbers of the poor to be denounced for the expensiveness from which the 'poor suffer'' A complete census of distribution is an essential preliminary to a thorough rationalization of the distributive trade The Committee against Malnutrition suggests that basic food should be taken deliberately out of the normal field of supply and demand, since food is a primary necessity and must be guaranteed inalienably to all Basic food should be marketed through public concerns boards should be established to handle the whole distribution of food from the point of production or import to the home of the consumer, the boards to be under the control of a Food Minister or of some existing Ministry such as the Board of Trade The system of

* Much of the subject matter under this heading is in the language of the Report on Nutrition by the British Association for Labour Legislation

centralized wholesale distribution presents great opportunities of economic organization but if any preference is to be granted to such a system in legislation adequate assurances should be obtained that these opportunities will be taken Space does not permit further reference to this matter, the urgency of which is self evident

Cheapening of Protective Foods

Measures to this end are concerned mainly with lowering the cost of distribution of protective foodstuffs and with increasing the demand for them Demand is largely a question of education and of income The problem of nutrition is fundamentally one of poverty though ignorance indifference and thriftlessness are not unconnected with it To solve it we must banish poverty and ignorance Large numbers of our people have not the means wherewith to purchase food that will satisfy their physiological needs For these the raising of incomes becomes a question demanding close consideration

The Raising of Incomes

A rise in the level of working-class incomes is almost invariably accompanied by a wider expenditure on the necessary protective foods But it does not of course, follow that the whole of the margin is expended on foodstuffs The Report on Nutrition (British Association for Labour Legislation) affirms that the standard of national nutrition could be raised by raising incomes lowering the prices of foodstuffs or reducing the fixed and prior charges on the family purse such as rent rates, and insurance premiums The possibility of introducing a system of family allowances and of securing wider adoption of one or other of the various rent rebate schemes should in the opinion of the authors of this report be investigated The Committee against Malnutrition on the other hand comes to the conclusions that an attempt to ensure adequate nutrition through raising incomes can at best only have partial and indirect results A scheme of family endowments only affects one section of the population A rise in other working-class incomes affects or is held to affect, the course of employment it is also considered frequently to influence the prices of food and other necessities by leading to a price rise that effectively swallows up the benefits from higher incomes Thus in any case it would be necessary for the price system to be manipulated by Government intervention if any advances in average working-class incomes are to be of benefit to the consumer

Palliatives

The present method in this and other countries of dealing directly with the problem of nutrition is that of providing free or cheap milk and other foodstuffs to the necessitous in certain sections of the community The method is a negative one it serves to treat or forestall in some measure the worst degrees of malnutrition as we experience them it does not envisage a situation wherein malnutrition is practically impossible In the second place and associated with the first consideration the schemes have been and still are administered in the spirit of the old Poor Law with the accompaniment of inspectors income tests and so forth Thirdly only certain sections of the community—for example school children and expectant and nursing mothers—are contemplated by the schemes and of necessity there must be numerous gaps and omissions Even at the best the schemes frequently work in a sporadic manner usually ceasing during the school holidays and at periods when the mother is unable to visit a clinic Meanwhile no consideration is taken of the fact that the organism requires an adequate diet all through its life and not merely at certain periods and during certain critical phases There is reason to doubt too whether the provision of milk however desirable solves the whole complex problem of individual malnourishment in some circumstances of dietary deficiency the consumption of extra milk may be of little use Finally it has been demonstrated that the provision of milk and other foodstuffs to the necessitous is a burden to local authorities in special areas of the country and may tempt them to provide meals of no great physiological value in the effort to conserve funds the responsibility should evidently be assumed by the nation as a whole and not left to the whim or the resources of local authorities —as it now in fact is Such are the views of the Committee against Malnutrition and we agree with them The committee suggests that there should be provided at the cost of the State to all elementary school children without discrimination a well balanced ample and sociable midday meal served in comfortably equipped centres open to supervision by the parents But valuable as this scheme would be for the school children it still leaves us with a selected group of the total population Probably any idea of a wider extension of communal feeding would be quite alien to conditions in Britain to-day and it seems doubtful whether the country would at present consider the large annual outlay needed to maintain even the scheme for elementary school children

A Many sided Problem

In concluding this necessarily brief summary of the facts and suggestions set out in the two documents we are reminded of a recommendation made in the final report of the Mixed Committee of the League of Nations on the Relation of Nutrition to Health Agriculture and Economic Policy (Geneva August 14 1937) which appears to have an important bearing on the subject under review

A national nutrition policy requires the guidance of some central authority with special responsibility in order to utilize to the best advantage the teachings of science interpret them in the light of national conditions and suggest means for their practical application In making this suggestion we were especially influenced by the many sidedness of the problems of nutrition and by the necessity for co ordinating economic and social action with new physiological teachings We are now more than ever convinced of the necessity for bringing together scientists economists agricultural experts consumers representatives teachers and administrators in National Nutrition Committees It is our firm conviction that through National Committees adequately representative of the various elements that go to constitute this complex problem the most useful progress can be made

MEDICAL RESEARCH COUNCIL TRAVELLING FELLOWSHIPS IN TUBERCULOSIS

The Medical Research Council announces that it has awarded Dorothy Temple Cross Research Fellowships to the following candidates who intend to study problems of tuberculosis at centres in the United States during the academic year 1938-9

A MEDICO-LEGAL INSTITUTE

GOVERNMENT AID WITHHELD

The following correspondence has passed between Lord Trenchard chairman of the Advisory Committee on the Scientific Investigation of Crime, and Sir Samuel Hoare the Home Secretary regarding the question of the establishment of a medico-legal institute in accordance with the recommendations made by the Committee in its report of June 1936[1]

Letter from Lord Trenchard to Home Secretary

'I am writing as chairman, on behalf of the non official members of the Advisory Committee on the Scientific Investigation of Crime—namely Lord Atkin Lord Dawson Sir Bernard Spilsbury Sir Robert Robertson Mr Hugh Lett Sir Frederick Menzies and myself—with regard to our future course of action You will recollect that the Committee was set up by Sir John Gilmour as Home Secretary on April 9 1935, and that we submitted an interim report on June 24 1936, which was published on July 25 This report therefore is nearly two years old and we have been seriously exercised as to what our future action should be

"We understand from you that though you welcome the principle of the establishment of an institution for medico legal research you find that owing to present day world conditions it is impossible for the Government to give any financial assistance at this time towards its establishment We feel that there would be no difficulty in the maintenance of such an institution but that there would be great difficulty in financing the necessary capital expenditure for the purchase of a site the erection of a building and the equipment of such an institution without adequate Government support We fully accept your opinion however that owing to the financial situation at the present time it is impossible for the Government to give that support which we consider necessary

We cannot conceal our disappointment at this decision for as we pointed out in our report the projected institute is a matter of pressing public importance There is hardly a capital in Europe that does not possess such an institution and we had hoped that the time had come when this country might cease to deserve the reproach of lagging behind the greater part of the civilized world in organizing research and instruction in a subject of such great public importance

But faced with the impossibility of carrying this great and important work to a satisfactory conclusion without Government support for the initial expenditure and sensible of the importance of seeing that all the work and research into this question which is embodied in our interim report should not be lost we feel that the Committee should be adjourned *sine die* It would then be possible for you to reconstitute it at any time that you consider suitable We believe that this would be the best course to pursue as it would be most unfortunate if the work that has been done so far were to be completely wasted

Of course if any public spirited benefactor came forward and offered to finance the capital expenditure or to give a large sum towards it it would then be possible for you to reconstitute the Committee and carry on the work which we hope we have been of some use in furthering

'We would remind you that when the report was published it aroused much public interest in the Press and inquiries have since been made as to the progress of this work Therefore we ask you to agree to the publication of this letter in the Press

The Home Secretary's Reply

I have received your letter of June 24, conveying the suggestion of the non official members of the Advisory Committee on the Scientific Investigation of Crime that the Committee should be adjourned *sine die* in view of the decision of the Government that they are unable in the existing financial situation to provide the necessary funds for the establishment of the medico legal institute which the Committee recommended in their report of two years ago I have discussed this project with the members of the committee and yourself on more than one occasion and I do not need to reiterate my personal sympathy with the object you have in view You will appreciate however that the demands made upon the Exchequer in the present abnormal situation are such that the Government cannot at the moment consider a scheme which however admirable it may be would involve a not inconsiderable capital outlay Unless therefore the necessary funds can be provided from some other source there is clearly no immediate prospect of the scheme maturing and I can only express the gratitude of the Government to the members of the Committee for the valuable work they have done in preparing the way for the further consideration of this project when financial circumstances permit I am in entire agreement with your view that the Committee should remain in being and I welcome therefore your suggestion that it should be adjourned *sine die* in order that it may be reconstituted when circumstances permit

I have of course no objection to the publication of this correspondence'

MATERNITY AND CHILD WELFARE CONFERENCE

A national conference on maternity and child welfare was held at Bristol from July 5 to 7 under the presidency of Mr R H BERNAYS Parliamentary Secretary to the Ministry of Health It had been organized on behalf of the National Council of Child Welfare and various of its constituent bodies by the National Association of Maternity and Child Welfare Centres and for the Prevention of Infant Mortality in co operation with the maternity and child welfare group of the Society of Medical Officers of Health and was associated with a clinical course for medical practitioners which was conducted on July 3rd and 4 After the opening speech by the Lord Mayor of Bristol Mr Bernays delivered his presidential address on the psychology of pregnancy in conjunction with the falling birth rate, in which he said that the maternal mortality rate last year had been 3·11 the lowest for the century but there had been no appreciable decline in the death rate of infants under four weeks old A discussion followed in which Dr ELEANOR JOYCE PARTRIDGE dealt with the tendency of advancing civilization to diminish procreation partly for economic reasons but also because of the existence of what she termed 'sex-starved spinsters Professor DREW SMYTHE had previously stressed the importance of the economic factor but Dr Partridge insisted on the part played by an attitude of fear of sex imbied in young girls by mistaken behaviour of their parents In the milder cases of this predisposition education could effect much good but in the more severe cases psychological treatment was essential In the evening of the first day there was a reception by the chairman and members of the Bristol Health Committee at the Clifton Zoological Gardens

Physical Fitness in Children

Mr R C ELMSLIE F R C S, opened a discussion on physical fitness in young children by reading a paper on postural defects in this class of the community He first defined a "defective posture' as one which was not necessitated by or adapted to what was being done at the moment and gave illustrative examples A defective posture further interfered with normal function, but to be considered a defect it must be habitual Temporarily relaxed attitudes were not always harmful Clothing must not be too tight, particularly across the chest and round the shoulder-joints Shoes for children must not be too stiff to bend under their weight Postural defects should

be treated by ensuring full mobility and by simple exercises for this and for control of balance and position and by other simple mechanical methods recommended by the medical practitioner Mr Elmslie added that during his lifetime he had seen a great diminution in the number and severity of postural defects resulting from improvement in hygiene in clothing and in physical education In young children minor orthopaedic defects were most likely to be encountered immediately after birth when the child began to sit and stand and with the starting of school attendance Mr JOHN BASTOW F R C S dealt in some detail with the treatment of minor orthopaedic defects

Co-operation between Organized Bodies

This session of the conference was opened by Dr F J POYNTON who spoke on the need for closer co operation between the school medical and maternity and child welfare services and the need for increased provision of convalescent residential accommodation for children under school age He was followed by Dr A S M MACGREGOR medical officer of health for Glasgow who insisted that the child welfare service and the school medical service could and should function most harmoniously under public health administration, the two services having now been amalgamated in most parts of Scotland and there being from the point of view of the Department of Health for Scotland no real break in the child's development medically between the ages of 1 and 14 The two services further came into close practical contact in the joint use of remedial clinics medical inspection of the pre school child and the nursery school Dr Macgregor gave details of what was being done in Glasgow mentioning the training course for teachers and explaining why he thought that on practical grounds it would be better to associate the nursery school with the child welfare service rather than with the school medical service He was followed by Professor R H PARRY medical officer of health for Bristol who said that co ordination of the two services was far from being general in the country generally at present Details were given of the methods of obtaining closer co-operation in Bristol and the creation of the first health centre in the Shirehampton (Portway) district of the city in 1935

Dr WILFRED PEARSON sponsored the claim of the pre school child to further consideration by the public and the provision of better convalescence facilities for children of that age in conjunction with better supervision in the home and adequate medical attention when required Periodic home visiting should be systematic while day nurseries and nursery schools should be multiplied Dr R COVE SMITH asked for the provision of emergency homes for infants and toddlers in cases of parental illness or domestic crisis He paid a warm tribute to the supplying of such day nurseries by the National Society and he enumerated the types of children which might be expected to benefit from an extension of such facilities Care must be taken to avoid institutionalization and it was necessary to provide a background which would give a sense of security and develop self reliance and initiative rather than dependence If temporary shelters were going to be provided by the Government as part of the Air Raids Precaution scheme some might be used from the start as emergency holiday homes until the more urgent need arose Under careful supervision the supply of adequate ventilation balancing of diet and the supply of suitable clothing there would be an improved environment with a minimal risk of cross infection The most satisfactory size for such homes would appear to be a nursery school of about fifty children presided over by a matron with nursing and nursery school qualifications, and assisted by a nursery school teacher, four staff nurses, and about fifteen probationers

Parental Considerations

Opening a discussion on the parents of the future Miss MARY MACAULAY considered a wide range of possible questions which were posed by children and adolescents and discussed how they should be dealt with She thought that far too little was being done to use the different ages of children to prepare them for their own eventual maturity and possible parenthood This paper led up naturally to the subject of sex teaching in girls clubs and Miss VIOLET SWAISLAND indicated various practical points which arose while Dr G DE M RUDOLF in a paper on sex teaching in boys clubs said that parents should be made to realize that knowledge of sex did not imply licence but rather that the sexual and acquisitive instincts could be turned to other than the direct uses of them Children should be taught that pre marital intimacy caused psychological harm and tended to lead to unhappy marriages while restraint before marriage led to more respect and happiness after the wedding day Dr EDWARD GRIFFITH read a paper on individual preparation for marriage

Reports of Societies

ROYAL MEDICO PSYCHOLOGICAL ASSOCIATION

Annual Meeting in Yorkshire

The ninety seventh annual meeting of the Royal Medico-Psychological Association was held at Ilkley from July 6 to 8 under the presidency of Dr JOHN R GILMOUR medical superintendent of Scalebor Park institution (West Riding County Council) The meeting was attended by several psychiatrists from abroad who brought greetings from their respective associations Dr R Gjessing of Oslo Dr Noel Peron of Paris Dr M Sakel formerly of Vienna and now of New York, and Dr J H Pameijer of The Hague

The Private Patient and Some Changes

In his presidential address Dr GILMOUR discussed some of the changes which had taken place especially with regard to private patients during his more than thirty years experience of Scalebor Park—the only local authority hospital solely for private patients he believed in the country The most noteworthy change he said had been in the incidence of general paralysis For many years this incidence was high now it was very low Alcoholism had been almost negligible among his patients Formerly it was accepted as inevitable that tuberculosis would break out in any mental hospital but it was now many years since a case had arisen in a patient at Scalebor or a member of the staff Influenza was still a potent cause of mental trouble Many of the cases were of what he called the August holiday type the initial attack of influenza took place in the winter or early spring followed by listlessness inability to concentrate headaches and increasing depression and after the August holiday had failed a number of patients sought the refuge of the institution A social change which lowered the numbers who could be discharged as relieved was the diminishing family which meant that often there was no disengaged relative to look after the patient

The greatest social change Dr Gilmour continued was the vastly increased public interest in psychological matters since the war accompanied by a decline in the observance of all forms of religion Thirty years ago the reply to the question as to a patient's religion was given unhesitatingly and without apology now the question had to be directed to his reactions to the cinema or recreation centre

'The younger generation are no longer looking outwards for their salvation but are driven deep into their inmost consciousness for a solution of their problems and finding there what does not give them peace they fly to the psychologist Man has turned to his own subjective processes and any maladaptation of these leads to a feeling of illness and that illness being psychic, must be treated psychologically'

Physio-pathology of Schizophrenia

Two of the three scientific sessions were devoted to schizophrenia, its pathology and treatment, and seven papers were contributed on convulsive shock therapy A cinematograph film illustrating insulin and cardiazol treatments was shown by Dr G W B JAMES It showed a normal morning of insulin treatment in one patient from injection to interruption the various manifestations of hypoglycaemia, and (a colour film partly in slow motion) the epileptiform convulsions induced by cardiazol Dr J H QUASTEL and Dr W T WALES read a paper on faulty detoxication in schizophrenia They had used the hippuric acid excretion test in sixty-seven cases of mental disorder, eighteen of which were classed as catatonics All the catatonic patients studied, without exception, showed a diminished ability to excrete hippuric acid at a normal rate The authors inferred that a metabolic disturbance of the liver affecting benzoic acid detoxication may be a characteristic feature of catatonic patients Dr R GJESSING of Oslo gave the results of a study of thirty-three patients including twenty-four periodic catatonics The investigation consisted of kinetic registration of a number of representative physiological functions daily or several times a week over a period of four to six months During the stupor-free and non-excited phases there was a gradual accumulation of nitrogen in the body which reached the threshold characteristic for each case When this level had been reached there was a sudden change in the vegetative tone the excess nitrogen was excreted and the patient entered the active phase of stupor or excitement as the case might be

Professor F L GOLLA, speaking on this last work said that his feeling was that here was offered a definite treatment based on somatic pathology for a certain—possibly very limited—class of patient At the same time he thought it would be the most unhappy thing if it were supposed that in order to improve the mental state of the patient it was only necessary to use the proper hormone for an endocrine gland which was functioning improperly Dr P K MCCOWAN also uttered some cautions suggesting that Dr Gjessing's work might not have the pathological significance he was inclined to attach to it and that there was a physiological explanation of some at least of the results he had been able to obtain

Convulsion Therapy

The first of several papers on shock therapy was by Dr MANFRED SAKEL, who described what he called his "pharmacological shock treatment' The overdosage of insulin manifested itself in two main groups first, in the form of the so called "wet shock" with coma and profuse perspiration, and, secondly, in the form of an epileptic seizure, frequently without perspiration—the so called "dry shock" As these two main groups could not be directed by insulin alone, he initiated the dry shock—if it did not occur spontaneously—by injecting cardiazol in the second or third hour after insulin, and thus provoking convulsions Dr Sakel presented a statistical record of 1,500 treated cases from New York State Medical Service The number of recoveries was given as 192 280 were said to be much improved, and 357 improved The ratio of improvement was definitely less with the duration of the disease, nevertheless, in cases of six years' or greater duration there had been recoveries and improvements Dr Sakel's statistics were criticized by some members because they had been compiled by a professional statistician, not a medical man One speaker, Dr H GILLIES declared that professionally compiled statistics were a little worse than useless From his own small series of insulin treated cases it required very little juggling to prove (1) that insulin was a complete cure for schizophrenia and (2) that it was of no use at all An honest impression was worth more than reams of statistics, and his impression was that insulin and cardiazol did in some way aid in the production of remissions

Dr L C COOK discussed the range of mental reaction states influenced by cardiazol convulsions Convulsion treatment, he said, did not pick out particular mental diseases or individual symptoms Its effects depended less upon the type of morbid reaction than upon its duration and depth and upon the degree of dissociation of personality Dr L W RUSSELL pointed out that the combined insulin cardiazol therapy enabled the fits to be controlled "The too placid patient gets his fit and the patient who is prone to fits has luminal to stop them, and has the fits as they are indicated by the use of cardiazol' In the "raw' cardiazol treatment the failure of the injection to produce a fit was often followed by agitation and nervous upset, but with the combined therapy the failed fit was less common because the patient was more prone to the fit, and also less upsetting because it was produced in a state which was so near to unconsciousness that it was completely forgotten Lately he had thought that subconvulsive doses of cardiazol were of great benefit They seemed to have a better effect in the stuporous cases than the full fit dose Patients often had a pathetic terror of the cardiazol injection, but insulin predisposed to the fit and also gave a complete amnesia besides having its own therapeutic effect

Psychological Aspects of Shock Treatment

A study of the behaviour of patients under insulin was presented by Dr EDWARD LARKIN Patients who recovered with insight he said, were able to describe their feelings whilst they had been in the schizophrenic state They agreed that the predominant feature was lack of interest in persons and things He gave a description of a method of quickening external interest during treatment With the treatment properly carried out the patient himself began to make efforts to reach out to reality and gradually to get away from the childish plane Dr Larkin added that observation of the behaviour of the nurses administering this technique indicated a possible neuropathology of schizophrenia which, if true, established part of the rationale of insulin and cardiazol treatments

Dr A DICK and Dr W MCADAM presented observations on four cases of cardiac complication in cardiazol treatment—auricular fibrillation in three, and the onset of heart-block immediately following a convulsion in another Dr L A FINIEFS discussed the dangers and emergencies of insulin therapy, these included premature incidence of coma, circulatory and respiratory complications, convulsions, delayed return to consciousness, and toxic reactions and after-effects

The use of a new convulsant drug, triazol 156, in the treatment of schizophrenic and other mental states was described by Dr A WALK and Dr W MAYER GROSS Its advantages were given as smaller dosage, lessened cost less unpleasantness to the patient, and the possibility of intramuscular administration Certain variations of the treatment were now being tried out, including the induction of prolonged "twilight" states without convulsions the induction of multiple convulsions, and the administration of convulsant doses with inhibition of the fit by amyl nitrite

Precautions and Qualifications

Dr ISABEL WILSON of the Board of Control said that a point which had emerged from the discussion was the value of standardization of technique It was important that those who were going to work with insulin or

cardiazol or any of these drugs should know the orthodox methods before they began Another point of great importance to bear in mind was that there was hardly a worker in this field who did not also rely on psychological methods of some kind It was out of the question to treat these patients with a mechanical substance and expect that to work the whole miracle As for the dangers of the treatment everyone was agreed that the more experienced the worker the less was the danger Sir LAURENCE BROCK chairman of the Board of Control mentioned that the Board was shortly publishing a report by Dr Isabel Wilson and Dr Rees Thomas on treatment with cardiazol as observed by them during a recent visit made at the request of the Board to Budapest, Vienna and Frankfort

Dr H PULLAR STRECKER said that it would be unfortunate if the idea became prevalent that mental disease could be cured by a few convulsions or comas This occasionally did occur but certainly not as a general rule The very advantages of cardiazol treatment constituted a danger—namely that the public or even the profession might come to believe that any case whatever its type or duration could be cured While admiring Dr James's cinematograph film he thought those who had seen the actual treatment with insulin and cardiazol would agree that it was not quite so drastic as the film made it appear Dr J H PAMEIJER Inspector of Mental Hospitals Holland said that in the mental clinics of the four universities in his country about 700 patients had been treated by insulin and 1 200 by cardiazol Individual cases did completely recover and in others there was surprising improvement But among the 700 cases subjected to insulin treatment there had been six deaths and four deaths among the 1 200 subjected to cardiazol He had also known fifteen cases of fractures occurring during cardiazol treatment Dr A A W PETRIE described the apprehensions of the patients subjected to cardiazol—a real point against the method Some of the patients had described it to him as worse than death

Genetical Problems in Mental Deficiency

The final session of the meeting was devoted to the subject of mental deficiency and two papers were contributed from the Royal Eastern Counties Institution Colchester Dr L S PENROSE in a paper on genetic problems said that rare dominant Mendelian characters might be the chief causes of mental defect in cases of Huntington's chorea epiloia neurofibromatosis and some types of oxycephaly Dominance in man was very often incomplete however, and the expression of dominant genetic factors was variable The genetic factors responsible for some relatively mild types of mental defect appeared to be incompletely dominant In some families the mating of two cases of mild defect produced offspring with severe defect Again in a number of types of congenital defect though there might be a genetic background environment was much more significant than heredity Congenital syphilis encephalitis and cerebral trauma from the medical point of view were simple environmental causes of mental impairment When the origin had to be sought for in the prenatal period the effects of environment and heredity were less easy to separate The maternal age at the birth of the child was aetiologically important in mongolism and also but to a lesser degree in anencephaly, hydrocephaly and spina bifida

Dr T A MUNRO presented a paper on consanguinity and mental disorder A survey of a large group of mental hospital patients showed that the incidence of consanguineous parentage was higher among psychotic patients than among persons suffering from general bodily diseases A comparison of 152 psychotic patients of consanguineous parentage with a similar group of unrelated parentage showed a higher incidence of schizophrenia in the consanguineous group Differences also appeared amongst the relatives of the patients in the two groups, those in the consanguineous group showing a higher incidence of neurosis and psychopathic personality Dr Munro exhibited the following table showing the parental consanguinity rate among patients in the Cardiff Mental Hospital and in the Cardiff Royal Infirmary respectively

	No. of Patients	Percentage Parents Consanguineous	Percentage Parents First Cousins
Mental Hospital			
Present patients	466	1·58	1·2
Former patients	1,146	1·04	—
Royal Infirmary	1 763	0·81	0·46

The nearer in blood to the patient the greater the chance of mental disorder Among patients who had blood-related parents he had found several instances of strange and rather atypical psychoses

Dr J A FRAZER ROBERTS drew attention to the people who exceeded the intelligence quotient average by the same amount as idiots and imbeciles foreshortened it—persons with intelligence quotients of 150 or thereabouts on the Binet scale as compared with the 50 of the feeble minded He was not sure whether the child with an extremely high intelligence quotient—a colleague had come upon a ten year boy whose quotient was just over 170—was not as abnormal socially as the imbecile Dr E O LEWIS said that it was a matter of pride that in this country there were two centres at which this kind of research was organized and carried on in a systematic way—namely, the Royal Eastern Counties Institution and Stoke Park Colony The younger generation of investigators like Dr Penrose worked on meagre data as compared with the long genetical tables of Karl Pearson and Goddard but the meagreness of the data was a merit because it showed that they were far more critical of their data than the older workers

At the annual dinner of the Association Sir JAMES BAILLIE Vice Chancellor of Leeds University in proposing the principal toast urged the need for more training in psychology for medical students He believed that 90 per cent of the students passing into the profession had had no proper or systematic training in general psychology at all It was not enough to study the abnormal A training in normal psychology was as necessary as in normal physiology He looked forward to the time—not distant he hoped in the case of Leeds—when every hospital attached to a medical school would have among its posts one dealing with mental aberration in its earliest stages

---

R Laporte and R Grimal (*C R Soc Biol* Paris 1938 128 42) have found difficulty in cultivating tubercle bacilli from material which has taken some days to reach the laboratory and which has arrived in a state of putrefaction With such material the ordinary sulphuric acid technique cannot be relied upon for the destruction of contaminating organisms Experiments have shown that a satisfactory way of preventing bacterial growth in post mortem and other material is to place the tissue in 5 to 10 times its volume of a 10 per cent. solution of sodium carbonate This solution has some destructive action on the tubercle bacillus but not very much more than Ringer Locke solution Material that has been soaked in it for some time becomes soft and can be ground up very readily with sand in a mortar Once a homogeneous suspension has been obtained the carbonate is neutralized with hydrochloric acid using litmus as an indicator The suspension can then be diluted with distilled water and inoculated directly on to tubes of egg medium Only if the tissue is badly contaminated before being placed in the carbonate solution is it necessary to treat it with sulphuric acid before cultivation

Local News

ENGLAND AND WALES

An Association of Special Hospitals

A conference of delegates from sixty-three London special hospitals was held at the Royal Westminster Ophthalmic Hospital on July 5 for the purpose of founding an Association of Special Hospitals. Lord Mersey, chairman of the Royal Westminster Ophthalmic Hospital, presided. Mr J. P. Wetenhall, house governor of the West End Hospital for Nervous Diseases, proposed that the Association of Special Hospitals be founded. He said that he had discussed with the vice-chairman of his own hospital fourteen years ago the possibility of forming such an association but the matter was not then carried further. The publication of the Sankey Report last year had brought the matter to the front again. After a preliminary conference held at Moorfields Eye Hospital last October an *ad hoc committee was formed, and as a result of its* deliberations the present meeting was being held. Sir Kenneth Wigram, chairman of the Cancer Hospital, seconded the resolution, which was carried unanimously. A constitution proposed by Mr Wentworth Stanley and seconded by Sir Mortimer Margesson was carried, and the association elected the following officers: president, Sir Kenneth Wigram; honorary treasurer, the Earl of Dudley (chairman of the Brompton Hospital); honorary chairman, Mr Wentworth Stanley (*vice-chairman* of the City of London Maternity Hospital); and honorary secretary, Mr J. P. Wetenhall. A council was elected consisting of two representatives of each of eight classified groups of *special hospitals—women's, children's*, ophthalmic, nervous diseases, ear, nose, and throat, chest and heart—with representatives from unclassified special hospitals including genito-urinary, cancer, and "long-stay" hospitals.

West London Medico-chirurgical Society

The president, Mr D. G. Rice Oxley, took the chair at this society's annual dinner held on July 6 at the Trocadero Restaurant. Viscount Dawson of Penn presented the society's Triennial Medal to Professor E. C. Dodds, who, he said, brought to his searchings after knowledge a Promethean fire and an untiring energy. His work on the purification of insulin had reduced its price considerably and brought about a great benefit to the community. His greatest work, however, was on the sex hormones. That very year he had produced a synthetic male hormone which outstripped anything Nature could produce. Professor Dodds, in thanking Lord Dawson and the Society, pleaded with his clinical colleagues to give research workers the greatest possible freedom. The generosity of the staff of the Middlesex Hospital in allowing him to wander into any branch of chemistry he chose had made possible the breaking of one of the strongest Continental patent rings in this particular group of substances. Proposing the health of the society, Lord Macmillan said that, like all good things it had grown up spontaneously and was the ideal club for a profession like that of medicine. They were entering on a romantic age of medicine, full of the stirring of adventure. The president, in reply, sketched the activities of the society, and Mr Alex Roche proposed the health of the guests, who included Dr Robert Hutchison, Sir Farquhar Buzzard, Sir William Willcox, and the presidents of many medical societies. Replies were made by Dr Robert Hutchison, Sir Henry Gauvain, and Mr J. E. H. Roberts. Dr Hutchison claimed the West London medal for heroism in the discharge of medical duties, on the ground of the large number of banquets he had to face as President of the Royal College of Physicians. He relied on the support of Lord Macmillan, that veteran of a thousand stricken banqueting halls.

Treloar Cripples' Hospital, Alton

On July 6 over 150 members of the medical profession of Hampshire accepted the invitation of the trustees of the Lord Mayor Treloar Cripples Hospital, Alton, to meet Lord Horder and to witness a number of special demonstrations by the resident and honorary medical staff. Lord Horder, in his address, contrasted the treatment of the crippled child thirty years ago when the hospital was founded with the treatment now given at the Treloar Hospital. The advance made, he said had been largely due to the work of Sir Henry Gauvain and his staff. They had done a great deal of the field work in that sphere of medicine and had settled the principles on which the treatment of the crippled child was founded. The scope of the work had been widened until it embraced any and every crippling condition. He had watched it grow, and he warmly congratulated Sir Henry Gauvain on the success he had achieved and the substantial contribution he had made to medical science. During the afternoon interesting cases were demonstrated by Mr H. A. T. Fairbank, Sir Henry Gauvain, Professor Hey Groves, Dr C. E. M. Jones, Mr T. Pomfret Kilner, Mr H. H. Langston, Dr R. L. Vollum, and Sir William Willcox. The hospital, the rebuilding of which has just been completed, and the New Treatment Centre which embodies all the most up-to-date modern appliances and improvements, provided a very interesting afternoon for the visitors.

IRELAND

Medical Research Council of Ireland

The Medical Research Council of Ireland has made the following awards. Dr Patrick J. H. Clarke. Whole-time grant for six months' training in juvenile rheumatism to be taken at various centres in London to be followed by a six-months' survey of the disease as it occurs in Dublin and district. Dr E. S. Duthie. Grant-in-aid for one year to enable him to employ technical assistance in connexion with an investigation of (*a*) chemotaxis in leucocytes and (*b*) enzyme content of lymphocytes, the work to be carried out in the Sir William Dunn School of Pathology, University of Oxford. Dr D. M. Mitchell. Grant in aid for expenses in connexion with an investigation of the effect of deficient diets upon the central nervous system and peripheral nerves, the work to be carried out in the School of Pathology, Trinity College, Dublin. Professor H. F. Moore. Grant-in-aid for anatomical and pathological technical assistance in connexion with an investigation of bundle branch block, the work to be carried out in the Anatomy Department, University College, Dublin, by Dr E. Keenan and in the Mater Misericordiae Hospital, Dublin, by Dr W. R. O'Farrell.

Royal Maternity Hospital, Belfast

The new wing to the Royal Maternity Hospital, Belfast, which has been named Johnstone House after Sir Robert Johnstone, was opened on June 28 by Lady Craigavon. It contains twelve beds in single rooms and one ward with three single-bed cubicles, two theatres, with a sterilizing room, a separate nursery with an annexe for incubators and a milk room besides other service rooms. The private wards are intended for patients who are able to meet the full cost of maintenance and medical treatment, and the cubicles for patients of limited means, the charge for the single room being higher than that for a cubicle. Sir Robert Johnstone who attended the ceremony spoke of the importance of safe maternity. It was the duty of the

public and of the Government he said to see that mothers were safe while giving birth to their children and that they were restored safe to their families afterwards It was not expected that Johnstone House although a paying block would bring in any enormous income Subscribers would have to continue their loyal support of the institution

SCOTLAND

St Andrews Ambulance Association

At the recent annual meeting in Glasgow of St Andrews Ambulance Association it was stated that during the past year 48 943 calls had been made for the service of ambulance wagons and that the total number of patients conveyed since the formation of the association was 818 372 In Glasgow alone during the year the ambulance wagons had turned out on an average fifty seven times daily The aeroplane ambulance service instituted in 1933 continued to grow and seventy four patients had been carried by this means during the past year The association had now eighty nine motor ambulance wagons of which seventeen were in Glasgow and the remainder throughout Scotland

Cremation in Scotland

At a conference on June 29 of the National Association of Cemetery and Crematorium Superintendents and the Federation of Cremation Authorities in Edinburgh Dr W G Clark medical officer of health for Edinburgh speaking on cremation from the standpoint of the public health official said that legislation threw upon the medical profession the responsibility of ensuring that in the disposal of the dead there should not be danger to other persons A badly situated cemetery might be a danger to the health of the nation although a modern cemetery properly constituted was not so As a public health official however, he believed that cremation was the hygienic method for disposal of the dead Dr Douglas J A Kerr medical referee to the Edinburgh Corporation read a paper on the Cremation Act and Regulations and said that at the present time control of cremation in Scotland was exercised by the Secretary of State through the Department of Health The ultimate aim should be to make cremation as convenient and economical as earth burial this could only be done if crematoria were at hand in every district With regard to the medical certificate he thought that a change was necessary The first medical certificate was of course essential but the wording required to be adjusted The certificate began Having attended the deceased before death and this was construed by some medical men to mean weeks, months or even years Further the provision for cremation during epidemics should be extended to cover deaths in air raids

Royal Blind Asylum

At the annual meeting of the Edinburgh Royal Blind Asylum and School on July 6 the question was raised of unemployed persons who received training at community centres in the city in work usually done by blind persons and, by undercutting restricted the markets for the goods produced by blind workers It was considered by one member of the board that the problem of blind workers could only be solved if institutions providing for them were taken over by the State The Royal Blind Asylum could not even afford to train all those who applied, some persons had been waiting six years to begin training Professor James Drever of the chair of psychology in Edinburgh University, said that the compulsory education of blind children dated in Scotland from 1890 but until the Act of 1936 came into force the education provided was elementary and the period of compulsory education extended from 5 to 16 years Many children how ever who to day would be recognized as educationally blind had been denied a satisfactory education because school boards did not send them to a blind school unless they were obviously blind in the popular meaning of the term The 1936 Act now required the provision of educational facilities from 3 to 18 years During the past twenty years blindness had been greatly reduced because the public health authorities had successfully tackled blindness of the newly born to day only one child was blinded from this cause as compared with ten twenty years ago About two thirds of all blind children at the present time were blind from causes outside medical aid and as a result they must make provision in their school for between 120 and 130 blind children

Princess Margaret Rose Hospital

A new Nuffield Ward at the Princess Margaret Rose Hospital for Crippled Children Edinburgh named in acknowledgment of a donation of £8 000 from Lord Nuffield towards the cost of the extension of the hospital was opened on July 4 by Mr John Colville Secretary of State for Scotland Mr Colville said that since Sir Robert Jones became a pioneer of modern orthopaedic surgery in England many thousands of children had been made whole and straight while many others had had their handicap in life reduced Orthopaedic surgery was not a simple process and treatment was prolonged sometimes to years it required therefore many kinds of skill and infinite patience There were no reliable figures as yet on which to estimate the number of persons in the country children and adults who were crippled in one way or another but these would be available when the survey of cripples in Scotland which was being carried out by the Central Council for the Care of Cripples was completed The Earl of Home president of the hospital, presided at the annual general meeting of subscribers and Harriet Lady Findlay in submitting the annual report said that the work of this hospital was growing every week Co-operation between the hospital and the local authorities in the south eastern area of Scotland was increasing and it was hoped soon to have the full number of clinics required for after care of patients treated in the hospital The finances of the institution were satisfactory but further funds were needed to provide an adequate endowment and for additional buildings Mr W A Cochrane said that during the past year there had been 232 admissions and the hospital through outside clinics was now caring for the large total of nearly 1 000 cases Patients were now being admitted in the early stages so that treatment could often be carried out in clinics for one child who needed to be admitted to hospital ten could be dealt with outside as out patients with great saving in cost and in suffering

Decreased Mortality in Fife

Dr G Pratt Yule who is retiring after twenty six years as medical officer of health in Fife in a valedictory address recently to the County Council Public Health Committee said that one of the most important features in the county was the fall in the infantile mortality rate In the period 1892–1906 the rate was 108 per 1 000 births but during the following fifteen years the rate fell to 97 and after 1922 there was a further fall to 79 Health visitors had had much to do with this result by teaching mothers how children should be fed and clothed Fife had been one of the first counties in Scotland to introduce health visitors When he qualified scarlet fever was a virulent disease and during the period 1912–21 the yearly scarlet fever death rate was 79 per 1 000, but between 1927 and 1936 it dropped to 65 In the former period there were twenty three deaths from typhoid fever, but during the last six years there had been only six deaths from this disease Similarly the deaths from measles had fallen from 161 to 64 while those from whooping cough had fallen from 260 to 113

Correspondence

Medical Relief in China

SIR,—In a recent issue of the *British Medical Journal* you very kindly inserted an appeal for help to keep the British hospitals in China supplied with necessary drugs and instruments during this time of stress and strain due to the Sino-Japanese conflict. The appeal, which is a special section of the Lord Mayor's Fund for the Relief of Distress in China, bore the signatures of a number of those whose names are well known in the medical world, and a copy was sent by post to members of the profession in England, Wales, Scotland, and Ireland—approximately 40,000 in number. I am glad to say that the list is too long for me to ask you to publish the names and amounts of those who have so far sent in their contributions.

Up to to-day's date 871 subscriptions have been received amounting to £1,540 7s. 10d., and although each one has been acknowledged with an official receipt, I wish through your columns to thank those who have responded, and at the same time to remind others who have not yet sent in their donations that for this special purpose £6,000 is needed, and we do hope that this amount may be forthcoming.

If there is one thing more than another which stands out in this welter of human suffering in China it is the way in which complete co-operation has been achieved in the matter of medical relief. No barrier of race or religion has been allowed to stand in the way, and the business man, the consular official, and the missionaries of all denominations have co-operated in trying to bring relief to those in distress. Cheques and postal orders should be sent to me at 121, Westbourne Terrace, London, W.2.—I am, etc.,

H. GORDON THOMPSON
Executive Secretary and Treasurer, Lord Mayor's Fund

July 11

Anti-venereal Measures

SIR,—Dr. Robert Forgan (*Journal*, June 25, p. 1389) seems to think he can easily make hay of the Ministry of Health Report on Anti-venereal Measures in Scandinavia by quoting a few ill-digested figures. He speaks of the decline of syphilis in England and Wales from 1922 to 1936 as being only from 25,000 to 18,000 as compared with that in Denmark from 2,400 to a third of that number. This latter he calls a drop of 300 per cent.—a new method of reckoning! I prefer the ordinary method, by which a reduction of 100 per cent. means a drop to zero. Thus a drop from 2,400 to 800 is a reduction of 66 per cent. But the figures of the two countries are not comparable, since the English numbers (25,000 and 18,000) are cases of syphilis *at all stages*. (See pp. 237 and 238 of the Ministry of Health Report for 1936.) What we need for comparison is the number of *fresh* cases of syphilis for each year, and this we have (in the same report) for the years 1931 to 1936. Now these figures show a decline in fresh cases of syphilis from 9,104 in 1931 to 5,675 in 1936—a reduction of no less than 38 per cent. in six years. From the earlier figures given in the 1936 report it is certain that a further considerable reduction of fresh cases had gone on during the decade 1922 to 1931, so that the total reduction of fresh cases between 1922 and 1936 cannot be less than 50 per cent. This reduction indeed is not so great as that claimed for Denmark and Sweden (about 68 and 72 per cent. respectively), but the difference is not startling. Incidentally, Dr. Lomholt questions the reliability of the Danish figures. If my contention is right, Dr. Forgan is not a little wrong.

In any case at the present time, Holland, which has not adopted compulsory measures, had according to this report a syphilitic incidence of 1.06 per 10,000 population in the year 1935, which is midway between the corresponding figures for Denmark and for Sweden. But the Ministry of Health's Report is not concerned only with statistics, the pitfalls of which are known to every statistician. The conditions of each country, external and internal, the character of the peoples, the density of their population, the nature of their industries, form a background which must be taken into consideration before applying to one country a system which may be suitable for another. The Commissioners have candidly stated that in Denmark and Sweden the compulsory system works without much hardship on or concealment by patients, this being due to the social outlook of the people and the influence of the medical profession. In Holland, where the population density is 667 to the square mile (as compared with Denmark, 224, and Sweden 39.5), we should expect the incidence of syphilis to be higher than in either Denmark or Sweden, and in Great Britain at least as high as in Holland. The figures given per 10,000 population are: Denmark, 2.1 (minimum 1.6); Sweden, 0.67; Norway, 1.5; Holland, 1.06; England and Wales, 1.7; and Scotland, 1.8.

I know that in this country there are many laymen and clinicians too, who in justifiable anxiety to get rid of venereal diseases wish to fly to compulsory methods. The wisdom of such a course must be determined not by statistics alone but by reflection on the character and outlook of the populace. I for one am convinced that here the effect of compulsory notification would, on the whole, be detrimental. From the report it is clear that the Scandinavian administrators say that legal compulsion is seldom employed though they think it is useful to hold in reserve. In spite of it, however, gonorrhoea, which is equally under compulsory laws, is not markedly decreasing in Scandinavian countries any more than in Great Britain.—I am, etc.,

DOUGLAS WHITE, M.D.

Dumbarton, July 6

Ischio-pubic Osteochondritis

SIR,—Being convinced that enlargement of the ischio-pubic junction, with or without some definite irregularity in density of the bone, was not nearly as rare as Mr. G. D. F. McFadden in his report of a case published in the *Journal* of June 18 (p. 1309) suggests, a limited search has been made in my personal records with results that seem to be of some interest.

Batches of consecutive films showing the pelvis in childhood were examined for this lesion. In 200 cases suffering from various affections of the hip twenty-five showed enlargement of the junction in one or more of their films. To give a few details: The first 130 cases of congenital dislocation of the hip provided eleven with the lesion on one or both sides of the pelvis. Both uni- and bi-lateral lesions occurred with either uni- or bi-lateral dislocations. There seemed to be no connexion between the appearance of the lesion and the manipulative reduction of the dislocation, since in most the ossification of the rami at the time of the reduction was but little advanced and the lesion was only found from two to eight years later. In one case the lesion was present before the reduction.

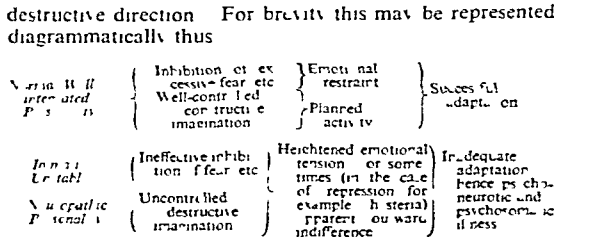
Of thirty six consecutive cases of pseudo coxalgia ten showed the ischio pubic lesion on one or both sides In three of these the lesion was unilateral and on the opposite side to the changes in the femoral head In the remaining seven cases the lesion was bilateral in only one of these were the changes in the femoral head also bilateral In thirty odd cases of various types including tuberculous and other infections of the hip four were found showing the lesion in two it was unilateral and in two bilateral Two of these four cases suffered from tuberculous disease of the hip joint In none of these twenty five cases were symptoms noted directing attention to the ischio pubic junction Were such symptoms present at any time they were either overlooked or misinterpreted In most of the cases the abnormality as seen in the films consisted only of enlargement of the junction in a few there was irregularity in density of the bone in addition In the majority of the cases films taken at a later date were available for examination in each such case the ramus had fused and presented a normal appearance

These cases it seems to me suggest that enlargement of the ischio pubic junction with or without some irregularity in density may occur as a developmental peculiarity devoid of any clinical significance Any inference which might be drawn from the higher percentage of lesions found in the pseudo-coxalgia group—a small group from which to draw conclusions—seems to be negatived by the fact that the numbers found in the other groups were far from being negligible

As to the cases with symptoms which appear to be due to the changes at the ischio pubic junction it was suggested many years ago by my colleague Mr George Waugh when showing me films of a case with definite symptoms that the pathology was nothing more than neglected trauma My small experience of similar cases—the notes of three such are before me as I write—strongly supports this suggestion Complete rest for no more than a few weeks permanently relieves the patient of all symptoms films taken later show complete disappearance of the lesion

There remains the question whether pathological changes worthy of the title osteochondritis ever occur at the ischio pubic junction Personally I doubt it if we take as our type pseudo-coxalgia in which be it remembered the changes progress markedly for several months before healing sets in and ultimately restores a normal density if not a normal shape to the femoral head Though I cannot agree with all the opinions expressed in his letter, I strongly support Mr G Edgar Church in his protest against the indiscriminate use of the term osteochondritis for every case in which irregularity in density and shape of an epiphysis or other fragment of bone forming in cartilage is not readily attributable to a definite cause In my opinion a large proportion of the reported cases have little or nothing in common with that interesting condition of the hip which I have suggested should be taken as the type and which passes under so many names among which pseudo coxalgia has the advantage of committing one to no pathology —I am etc

London W 1 June 11 H A T FAIRBANK



Rising Incidence of Psychosomatic Illness

SIR —Dr James L Halliday in his interesting article (*Journal* July 2 p 11) appears puzzled by the rising incidence of disorders of psychological origin I submit that much of this increase is apparent rather than real When I was physician to the Birmingham Nerve Hospital before the war I could not help being impressed by the large number of out patients attending there who had been turned away from other hospitals because no organic basis for their complaints could be discovered In those days which seem so long ago the psychological factor in disease was pooh poohed and such patients drifted about until they found a doctor who realized that dyspepsia and other disabilities could be caused by ideas as readily as by physical or chemical irritants Disturbances arising from the physical concomitants of emotions were but little understood and a sufferer from them was disdained as a *malade imaginaire* and a nuisance This had a deterring effect Now such disorders are beginning to be generally appreciated even classified and tabulated and to this extent their increase is only apparent

There is however another important factor—what the Germans call the *Krankheitsgewinn* Since psychogenic illnesses have become not only recognized but rewarded a person who suffers from the physical changes associated with anxiety and other emotions instead of being turned away is now given elaborate treatments certificates of unfitness for work and perhaps a holiday at a convalescent home Thus he lacks incentive to adjust himself to or overcome a trouble from which he indirectly profits Physical treatment alone tends but to fix the symptoms During the war in the special neurological hospitals (I speak especially for Maghull) while hostilities continued psychoneurotic soldiers were difficult to cure Being in hospital and out of danger satisfied their unconscious longings After the armistice however most of them got well with surprising rapidity thanks not to them nor to their physicians but to the fact that the cause of their fears had ceased to operate and early discharge offered advantages Then followed the Ministry of Pensions clinics on which I also served and there again I met with the *Krankheitsgewinn* factor—the larger the pension the more difficult the treatment I do not refer to conscious malingering though this also existed but to the unconscious clinging to a symptom for its secondary value Now that in many forms a comparable reward is easily obtained we must expect a real increase in the number and duration of psychosomatic illnesses —I am etc

Caldecote July 5 A E CARVER

SIR —The present widening interest in the psychogenic aspect of illness will be reinforced by the opportune survey contributed by Dr J L Halliday to the *Journal* of July 2 (p 11) It is becoming increasingly evident that in a large number of cases of functional nervous disorder there is an initial failure on the part of the individual concerned to adapt and adjust himself to his environment The underlying psychological conflict tends to resolve itself along the familiar lines of either mental or physical disability the particular variety of which appears to be conditioned by the personality make up of the patient in each case In this connexion two (among several) important factors appear worthy of attention—namely (*a*) the individual's power of inhibiting his own instinctive fears etc and (*b*) the trend of his imaginative activities—that is whether in a constructive or destructive direction For brevity this may be represented diagrammatically thus

Power of adaptation is the keynote Where the normal stable individual would skilfully tack or take in sail to meet life's sudden squalls, the "neuropath" imbued as he often is from the start with a spirit of congenital defeatism tends to heel over and capsize The remedy lies to hand and involves (1) systematic inculcation of sound psychological principles during every student's hospital training and (2) earlier detection of and psychotherapeutic assistance for, the unstable type of individual who would otherwise drift into psychoneurotic or psychosomatic illness—I am etc,

Boscombe, July 4 W V HARKE

The Unconscious Mind and Medical Practice

SIR—The art of psychotherapy, like the art of other branches of medical practice can only be learned through its exercise The textbooks which Dr G Waugh Scott (*Journal* July 2 p 39) has read should have given him an insight into the general principles of analytical psychology Every case however, is a separate problem, and in the nature of things it is impossible to provide him with a *vade mecum* in which he has only to refer to the index to find a specified treatment for each symptom Take the two cases which he brings forward as illustrations both the man and the woman are punishing themselves by inflicting on themselves the thing they fear most, the thing most damaging to their respective egos To clear up the condition one would have to discover the source of the childish unintegrated guilt which they are thus expiating and investigate the current mental conflicts which have revived the latent ones

My advice to Dr Waugh Scott is to begin the investigation boldly on the general lines which he has learned, leaving the particular symptoms to take care of themselves He will soon find that he is accumulating a wealth of material which will point the way to a cure *Solvitur ambulando*'—I am etc

Birmingham, July 4 R MACDONALD LADELL

Mental After-care

SIR—May I be permitted to lay before readers of the *Journal* a brief account of the aims and activities of the Mental After-Care Association the nature of whose work is inclined, unfortunately, to be known only to a limited public specially interested in mental or nervous illness We feel that if a greater knowledge and insight were given as to the valuable assistance rendered through this association to patients leaving mental hospitals the sympathy of a very much larger public would be obtained

The stormy progress of the mental hospital towards honourable recognition is becoming increasingly well known, and it was in 1879 that this association was founded with a view to helping patients leaving mental hospitals to readjust themselves to a great extent before they were expected to face the difficulties of normal life, from which many may be cut off for a period of years Our convalescent homes enable those patients to spend a few weeks in an atmosphere less disciplined than that of hospital routine, and at the same time not so completely lacking in supervision as is expected when they leave to take up work in the ordinary way

Unfortunately, it is still true that the layman is inclined to distrust the man or woman who has been in a mental hospital no matter what the cause may have been, and in this respect we have through our employment bureau been able to assist patient and employer alike by placing the patient in suitable work and by interviewing the prospective employer who then feels that he can apply to us if he is dissatisfied, while each patient who passes through our hands knows he or she can look to us for a sympathetic reception should occasion arise Our most recent addition has been the inauguration of a summer holiday to suitable patients still under treatment in hospital and the experiment has been well justified This summer we hope to give two weeks' holiday to over one thousand patients from various mental hospitals

As your readers will readily understand, all this entails a great deal of expense, and if our high standard of efficiency is to be maintained we must look to our very many good friends to assist us Even the smallest amount will be most gratefully received—I am, etc,

REGINALD WORTH
Chairman Mental After-care Association
Room 354, Grand Buildings,
Trafalgar Square, W C 2

Treatment of Pneumonia

SIR—To quote from your leading article of June 25 (p 1371) "If chemotherapy can equal or even approach serum therapy in efficacy serum will stand little chance of more extended trial Certainly the results obtained recently by Dr Telling and Dr Oliver (*Lancet* 1938, 1, 1391) and in a hundred consecutive cases by Dr Evans and Dr Gaisford (ibid, 1938, 2, 14) indicate a definite superiority over serum treatment The difficulties of treatment by specific sera are obvious Sera have been used with success in America against many different types of pneumococci but only Types I and II antisera have been much used in this country If serum treatment is adopted typing is essential, but in many cases sputum is not obtainable early enough Surely it should be possible to obtain the specific organisms directly from the pneumonic lung by aspiration with an exploring syringe Serum treatment has other disadvantages—for example the possibility of anaphylactic reactions occurring The effects upon the pneumococci of the chemotherapeutic agent and of a type-specific serum are essentially similar The specific serum combines with the capsule, upon which the virulence and type specificity depend, detoxicating the organism and making it vulnerable to phagocytosis T693 also has a definite action on the capsule In either case the pneumococci lose their virulence and are readily destroyed by leucocytes

Professor Fleming (*Journal* July 2, p 37) recommends that specific immune serum should be used together with the chemical agent, because he found that human blood with the addition of T693 and immune serum could deal with a much larger infection than the same blood containing either T693 or immune serum only Cannot the same effect as that achieved by a combination of serum and T693 be obtained by giving a larger dosage of the chemical agent? T693 according to Whitby, has a great advantage over sulphanilamide in being relatively non toxic, although active, in small doses

Evans and Gaisford in a few cases gave as much as 9 grammes in the first twenty four hours with beneficial effect There were no toxic symptoms with the exception of cyanosis—in about a quarter of the intensively treated cases—which disappeared when the drug was withdrawn If it is possible to increase the amount of the drug when the infection is especially severe without detriment to the patient, surely there can be no necessity to supplement its action with serum

It is upon the efficiency of the polymorphonuclear leucocytes that recovery from pneumonia ultimately

depends if they fail neither serum nor chemotherapy can save the patient's life. The onset of granulocytopenia during the course of acute pneumonia is of fatal significance and even leucopenia is of serious import. J. B. G. Muir (*Journal*, April 30, p. 942) records a case of pneumococcal peritonitis in a child aged 10 in which the leucocyte count fell rapidly to 2,700 per c.mm. but treatment with pentose nucleotide raised the count to 27,000 per c.mm. in a few days and the patient eventually recovered in spite of the complication of double lobar pneumonia. Even when leucocytosis remains at a considerable height the bactericidal power of the blood may be deficient. Leucocytes from different individuals especially those suffering from acute infections may vary considerably in phagocytic activity. In such cases the addition of fresh human blood from a suitable donor especially if of high leucocytic activity may turn the scale in the patient's favour. The leucocytic content of the donor's blood may be increased by a previous injection of sodium nucleinate and the leucocytes' non-specific phagocytic activity may be enhanced by the intravenous injection of a small amount of staphylococcal vaccine a few hours before the blood is withdrawn or it may even be added to the blood after withdrawal. Frequent blood counts with differential leucocyte counts during the course of the illness are a useful guide to treatment.—I am, etc.

Worthing, July 5 HERBERT H. BROWN.

Psittacosis

SIR,—In the *Journal* of April 2 (p. 737) there appeared a leading article on psittacosis in which it was stated that a carrier state is readily set up in budgerigars, and that it is from such apparently healthy carriers that many of the human cases have arisen during the last few years.

In October 1937 I attended a female patient aged 56 who died from an atypical bronchopneumonia on the eighteenth day of her illness. Her temperature fell to subnormal on the seventh day, and for the ensuing eleven days remained subnormal. During this period her respirations varied from 52 to 58 a minute, and her pulse rate remained constantly at 120 a minute. On the day of her death her pulse rate fell to 72.

It is interesting to note that her husband bred budgerigars, and at times the patient had attended to them. The birds were kept in somewhat close proximity to the kitchen. Examination of the birds failed to reveal any sign of psittacosis. Nevertheless I am of the opinion that her death was due to psittacosis. In Australia and New Zealand the budgerigar has become a favourite household pet. Some fond owners kiss their budgerigars goodnight with a regularity calculated to arouse the jealousy of a perhaps somewhat neglected child! Let us hope we shall not hear in the future of what may be termed a budgerigar complex! In all seriousness I believe that unrecognized cases of psittacosis have probably occurred in Australia and New Zealand. Might it not be as well to record all cases of severe pneumonia in which the patient has been in contact with sick or apparently healthy budgerigars?—I am, etc.

Auckland, June 1 J. P. HASTINGS.

Treatment of Placenta Praevia

SIR,—In the case described by Dr. H. Gordon Oliver (May 14, p. 1071) Willett's forceps applied to the scalp with slight traction might have been a suitable form of treatment. Dr. Oliver seems to have been particularly lucky with his case. With a low placental implantation the cervix is like wet blotting paper and attempts at manual dilatation are often likely to cause serious trauma and haemorrhage. The prolonged manipulation is also likely to increase the risk of sepsis. Delivery of a full-term baby (5½ lb. in this case) through an os seven eighths dilated carries the risk of damage to the cervical supports with possibilities of gynaecological complications.

Another point that needs comment is the fact that Dr. Oliver administered prontosil after the case actually showed signs of sepsis; this should have been given as a prophylactic from the start with such extensive manipulation carried out near the site of placental implantation.

If vaginal examination is carried out with due attention to asepsis using gloves and a mask this will not be any serious contraindication to a section. Cases of marginal placentas rarely assume a serious state and can usually wait and all cases of uterine haemorrhage during the last few months of pregnancy unless too far away ought to be transferred to a hospital after an injection of morphine without a vaginal examination unless one is fully equipped and prepared to deal with a case on the spot. The slight loss that the patient may have in transit can be easily made good by a transfusion at an institution.—I am, etc.

District Hospital, Sunget Patani, Kedah, Malaya, June 22 S. K. KELKAR.

SIR,—We would like to thank Professor F. J. Browne for his helpful criticism (*Journal*, July 2, p. 38). We cannot help being surprised however when we read his query. Do the writers really believe that packing the vagina controls haemorrhage from placenta praevia if the membranes are unruptured? We would respectfully urge Professor Browne to re-read our paper and in particular the section headed "Principles and Practical Aspects of the Treatment" in paragraph 3 of which we wrote: "When either marginal or lateral placenta praevia was diagnosed the membranes were artificially ruptured whether the patient was in labour or not and as much liquor as possible was allowed to escape. This usually led to satisfactory descent of the presenting part and packing the vagina was employed only if bleeding was profuse or continuous." Again in paragraph 6 (c) we wrote: "While packing of the vagina in conjunction with artificial rupture of the membranes is a recognized stimulus to uterine contraction we have not found that unduly rapid delivery resulted."

Only in cases of central placenta praevia was plugging ever employed before the membranes had either ruptured spontaneously or been ruptured artificially. We would not attempt to defend plugging *per se* but only as an integral part of the routine to be adopted under the circumstances described and would stress the fact that it should always be performed under strictly aseptic conditions preferably in hospital. We hope that these quotations explain the principle employed which was to effect haemostasis by compressing the placenta between the foetal head above and the plugging below.—We are, etc.

Samaritan Free Hospital for Women, London, N.W.1, July 9 J. E. GIESEN, O. LLOYD.

Small-pox and Compulsory Vaccination

SIR,—A statement is made by Dr. A. L. Craddock in his letter on diphtheria prophylaxis (*Journal*, July 2, p. 42) which really cannot be allowed to pass unchallenged. After referring to the entire freedom of this country from fatal small pox in 1937, he goes on to say: "There can be little reasonable doubt that the remarkable position in

respect of small-pox is due largely to compulsory vaccination If Dr Craddock really believes this I can only suppose that he is entirely out of touch with current views among those most familiar with the questions of the aetiology and prophylaxis of small-pox I wonder if he knows that resolutions in favour of the abolition of compulsory vaccination have been passed by both the Association of County Medical Officers of Health and the Society of Medical Officers of Health, and does he realize that the disappearance of fatal small-pox in this country has largely coincided with a continuous decline in compulsory examination? Also is he aware that localities which have taken the lead in the abandonment of compulsory vaccination have shown just as great a reduction in small pox mortality as the rest of the country? In the city of Leicester where compulsory vaccination was abandoned over fifty years ago and where for many years the proportion of infants vaccinated has been less than 5 per cent there have been only two deaths from small-pox in the last thirty-three years—I am etc,

Leicester July 5 C KILLICK MILLARD

Psoriasis

SIR—I read with interest Dr John T Ingram's excellent article on psoriasis (*Journal* April 23 p 881) I have been using ultra-violet radiation in combination with various unguents in the treatment of psoriasis for the past two years, and in many cases have found it very satisfactory In treating some of my fellow practitioners I have tried out, successively salicylic acid, mercurials, cignolin and tar preparations in ointment or paint form together with the ultra-violet light I found that the tar preparations were the most effective and for cleanliness a paint with an acetone and benzol base was preferred Many patients with psoriasis state that they are free from this condition in the bathing season, and usually give the credit to the sea and water Many are so sensitive about their eruption, however, that they will not appear in a bathing suit

I agree with Dr Ingram that a small ultra-violet lamp in the patient's home would be most valuable to prevent recurrences, but I do not agree with his method of giving a small daily dose I consider that most of the benefit is derived from some degree of erythema, most areas require only a very mild reaction, but resistant areas, like the knees and elbows, need a brisk reaction I have had several patients come to me from the northern Australian sheep stations, where it is very hot and very sunny From constant exposure (working with their sleeves rolled up) their forearms, hands, faces, and necks have been very deeply tanned, but these tanned areas have been just as much affected by the psoriasis as the covered areas In treating these patients moderate exposure to ultra-violet light and the application of an ointment will clear up the covered parts, but on the exposed areas a heavy dosage of ultra-violet rays is necessary Does it not seem rational to suppose that with frequent applications the skin will cease to react to moderate doses and the psoriasis will return, as on the exposed parts of the patients I have mentioned, and is it not also likely to increase the risk of keratosis developing later? I have advised the smallest amount of exposure necessary to clear up the attack, and have found little, if any, increase of dosage necessary for the recurrences—I am, etc,

WM GILFILLAN,
Adelaide, May 31 Clinical Assistant, Skin Department, Adelaide Hospital

Complications of Gold Therapy

SIR—I am glad to see that Dr H Warren Crowe (*Journal* July 2 p 44) has become a convert to gold therapy and I feel he deserves our congratulations on his results in that he has never had a toxic reaction in his series This experience I am sure must be unique He states that 'gold is given in minimum doses at as long an interval as possible depending on the tendency of the symptoms to recur My own experience is that those cases which have done best in the end have had a recurrence of symptoms during treatment Having tried gold in the very small doses prescribed by Dr Crowe I am not surprised that there is no reaction, but on the other hand I have failed also to secure beneficial effect, no complication is likely to arise after the administration of one hundredth of the initial dose

I do not agree that "the kind of gold salt used does not appear to make very much difference This again is contrary to the experience of most workers I have seen marked differences with the various salts used which is not unexpected, considering their different chemical characteristics During the past year however using neo solganol which is a calcium-gold keratin preparation it has been found that reactions have been much less marked and the progress much quicker than with other preparations In only one case so treated has there been any skin reaction

It must be very difficult of course to assess therapeutic effects when two separate treatments based on entirely different conceptions of therapy are being used simultaneously—I am etc,

London, W 1, July 5 GERALD SLOT

SIR—Dr Warren Crowe is to be congratulated upon the satisfactory results he obtains with 'gold injections and particularly upon the absence of "any toxic reaction of any kind whatever

Auro intoxication is nevertheless a problem which confronts most other workers in this particular field A considerable amount of experiment investigation and inquiry has been carried out at the Royal National Hospital for Rheumatic Diseases Bath to find a method of predicting those cases which may suffer from intoxication by 'gold, but so far without result The giving of small doses does not ensure the absence of reaction added to which the reaction may be delayed for some weeks after the last injection A hospital patient of mine developed auro-intoxication with skin lesions after a total of 0 17 gramme divided in five doses at weekly intervals—I am etc

Bath July 4 JOHN B BENNETT

Quinsy-Peritonsillar Abscess

SIR—Having read the correspondence on "Quinsy-Peritonsillar Abscess and noted that it is often found difficult to evacuate the pus effectually may I (although not a surgeon) venture to describe a method which I have frequently found to be very effective

When the abscess is behind the tonsil and cannot be opened properly and the neck is swollen at that side I make a small incision (under local anaesthetic) just behind the sterno mastoid about the level of the chin and cut through fascia then take sinus forceps and insert the closed point passing it behind the sterno mastoid (postero medial) and forward Then draw the handle forward so that the point moves in a curve forward medially, and up and then further up and slightly back

till the point is almost behind the tonsil Then open the forceps and pus pours out insert glove drain

One has to go slowly and gently and feel the way My first patient collapsed momentarily and recovered (probably pressure on a sympathetic ganglion) Have the neck very slightly flexed in the process —I am etc

Edinburgh July 8

The Final M B B S Lond

SIR —You were good enough to give hospitality in your columns in the early part of this year to a discussion of certain suggestions for a measure of co operation with the Conjoint Board of the Royal Colleges in the final examination for the M B B S of London University The Senate were informed in a memorandum (dated January 11 1937) presented by the then Vice Chancellor to the Board of the Faculty of Medicine of London University and thereafter communicated to the Senate that of the medical students receiving their education in London only 17 per cent obtained a degree and it was upon this information subsequently proved to be erroneous that the Senate in May 1937 authorized the Board of the Faculty of Medicine to discuss with representatives of the Royal College of Physicians and the Royal College of Surgeons the problem submitted to the Senate by the Court—namely the small number of students in Medical Schools who take a Degree of the University of London

Acting upon this authorization delegates appointed by the Faculty Board from its own membership conferred with delegates from the Royal Colleges The result of *this conference as it affected the Royal Colleges* was submitted to the Comitia of the Royal College of Physicians on May 12 1938 in the following terms After giving long and serious consideration to the matter the Delegates (of the two Royal Colleges) came to the conclusion that the plan of a common examination presents so many difficulties as to be impracticable *nor do they think that it would be in the best interests of medical education in London* [The italics are mine —E G L] They therefore recommend the Royal Colleges not to agree to it The recommendation was then and there adopted without modification and without any dissentient voice by the Physicians and a few days later by the Surgeons This decision of the Royal Colleges was reported to a meeting of the Board of the Faculty of Medicine on July 7 1938, and the Board had obviously no alternative but to acquiesce in it

Thus ends the third effort in forty years to establish a common standard of examination in the final medical examinations of the Conjoint Board and the University The first sustained drive in this direction was made during the sitting of the Gresham Commission in 1894 It was the evidence given to that Commission by that veteran and doughty fighter Sir William Collins that was chiefly responsible for the rejection of the proposal by the Commission and graduates in medicine of London University owe him special gratitude The second effort was made in 1912 during the sitting of the Haldane Commission and was it was thought killed by the masterly statement contained in the report published in 1913 demonstrating very conclusively that the suggested co operation would not be in the true interests of medical education thus anticipating the verdict now recorded by the Royal Colleges themselves which we may hope will finally discourage any further attempt of this nature

At its meeting in May 1937 the Senate upon the motion of the External Council took the step of appointing a second Committee of its own body to consider

(*a*) how far the problem mentioned in the Vice Chancellor's Memorandum of January 11 1937 can be solved within the Statutes and

(*b*) the statistical purport of the difficulty

and that this Committee report to the Senate through the Academic and External Councils

Upon the advice of the Vice Chancellor no meeting of this committee has yet been called as it was considered advisable to await the outcome of the conference between the Board of the Faculty of Medicine and the Royal Colleges Now that this Conference has come to the decision recorded above the way is open to investigate the real position of the problem the seriousness of which was undoubtedly exaggerated in the memorandum of January 11 Professor Greenwood has contributed to the medical press certain statistics which would indicate that 50 to 60 per cent would be an approximation to the per centage of London University students in medical schools who take *the final medical degree of the University* These figures though still unsatisfactory are not nearly so calamitous as the Vice Chancellor's Memorandum suggested and modifications entirely within the power of the University to make such as more frequent examinations new adjustments of the curriculum etc may bring about the further improvement anticipated and hoped for by the Court during the next quinquennium —I am etc

E GRAHAM LITTLE

House of Commons July 10

The Medical Directory 1939

SIR,—To maintain the accuracy of our annual volume we rely upon the return of our schedule which has been posted to each member of the medical profession Should the schedule have been lost or mislaid we will gladly forward a duplicate upon request The full names of the doctor should be sent for identification —We are etc

Obituary

HARRY CAMPBELL M D F R C P

Consulting Physician West End Hospital for Nervous Diseases London

Dr Harry Campbell who died on July 8 was the sixth son of Hugh Campbell of Eweland Hall Margaretting Essex and was educated at Carshalton House and in Germany at Neuwied am Rhein and then entered St Bartholomew's Hospital where he was prominent in work and play captaining the Rugby XV of 1881 which won the inter hospitals cup In the same year he qualified M R C S and graduated M B B S Lond in 1882 proceeding to the M D in 1885 He was elected soon afterwards to the staff of the North West London Hospital as assistant physician and pathologist and retired as full physician in 1919 In 1896 he was elected a Fellow of the Royal College of Physicians of London and joined the visiting staff of the West End Hospital for Nervous Diseases to which he was physician for many years and finally consulting physician

Lancet July 31 1937

Outside the practice of medicine Dr Campbell had many intellectual interests He was a Fellow of the Anthropological Society and a former President of the Society for the Study of Inebriety He had a clear and agreeable literary style, and his writings covered a wide range of subjects the physiology of eyesight, flushing and morbid blushing, differences in the nervous organization of men and women respiratory exercises in the treatment of disease man's mental evolution past and future, and the principles of dietetics He published in 1889 a philosophical essay on *The Causation of Disease* and in 1924 *Fundamental Principles in Treatment* and a number of other books stand to his credit He also edited the fifth edition of *Aids to Pathology* and was for fifteen years editor of the *Medical Press and Circular* Everything he wrote bore the stamp of a thoughtful, inquiring and critical mind

Dr Harry Campbell joined the British Medical Association forty-five years ago He was vice president of the Section of Neurology and Psychiatry at the Annual Meeting at Newcastle upon Tyne in 1921, and vice-president of the Section of Medical Sociology at the Annual Meeting in Dublin in 1933 From time to time throughout his career he contributed to the columns of the *British Medical Journal*, and a short letter pleading for a precise definition of the term "unconscious," written only a few days before his death appeared in our last issue

Dr C O Hawthorne writes

To not a few of the seniors among us the death of Harry Campbell means the close of a rare friendship and the revival of many memories He had a place of his own and it was a place in the affection as well as in the regard and admiration of his fellows His store of knowledge was vast and varied, the fruit of wide reading and careful observation, and the material supplied by the one as by the other was analysed and arranged by a highly critical and reflective mind His numerous writings carry the mark of these processes and provoke thought as well as supply it Medicine was for Campbell a department of natural history, and he cultivated all the avenues, remembering always that in the care of the patient is the true opportunity of the physician Generally, though he delighted in teaching, he was more effective with the written than with the spoken word, for gentleness and persuasiveness rather than emphasis marked his method, and the unqualified proposition was hardly within his vocabulary With the pen he was a literary artist, insistent on precision both in definition and in argument and not a few of his contributions have left an impress both on medical and on philosophic thought Best of all he was a gentle, unselfish, and sensitive soul, with no thought of envy and no ungenerous word And it is the memory of these things that will abide with those who knew him long and loved him well

We have received the following tribute to the late Dr CHARLTON HALL from Drs Constance D Roberts, W E Rutledge, and Ian D Dickson At this late period we feel it is not out of place to record a note of appreciation of the privilege of having known Charlton Hall It is doubtful if any member of the medical profession in the district was more popular, not only among his colleagues, but in the hospital over which he presided As superintendent of the City of Norwich Mental Hospital it was his constant wish to make the patients feel that they were members of one large family being cared for as sick-minded rather than surrounded by asylum walls and in this he succeeded We have known Dr Hall as a friend, a physician and a sportsman, and in none was he lacking in enthusiasm and thoroughness Perhaps his most striking characteristic was his ability to see the best in his fellow men He was indeed the friend of all the enemy of none Norwich has lost a great character and humanitarian, whose place will be difficult to fill The sympathy of his colleagues staff, and patients goes to his widow who in the past was such a help and inspiration to her husband

Dr HENRY OTTRIDGE REIK who died on June 2 was one of the three delegates to the centenary celebrations of the British Medical Association in 1932 from the American Medical Association Born in Baltimore Maryland in 1868, he graduated from Maryland College of Pharmacy in 1888 and M D in 1891 from the Maryland University School of Medicine He was in general medical practice from 1891 to 1894, and after postgraduate courses in Johns Hopkins University and in Glasgow and London including work at Moorfields Eye Hospital he returned to Baltimore to specialize in diseases of the eye and ear He held the post of professor of ophthalmology and otology in the Johns Hopkins Medical School from 1896 to 1912, and was a founder of the Baltimore Eye Ear and Throat Hospital He was general secretary of the International Otological Congress from 1909 to 1921 During the war he served in the United States army with the ranks of captain, major, and lieutenant colonel from 1917 to 1919 and was promoted colonel in the U S A Reserve Corps in 1923 An injury to his right hand prevented his return to surgical practice, and he was appointed secretary of the New York Academy of Medicine committee on postgraduate medical courses from 1919 to 1920, in the latter year he was appointed editor in chief of international medical and surgical surveys and four years later he became executive secretary of the Medical Society of New Jersey and editor of its *Journal* He was the author of *Surgical Pathology and Treatment of Diseases of the Ear* and *Diseases of the Ear Nose and Throat* and books on the conservation of the special senses and the national parks of America He was a member of the American Ophthalmological Otological and Laryngological Societies

Dr JAMES ANTHONY MCVEA died on June 6 at his residence in Netherton Ayrshire After early education at Ayr Academy he went to Glasgow University, where he graduated M B Ch B in 1903 He was subsequently for a time assistant to Dr James McGill of Colyton and then practised for some years with his sister Dr Janet McVea, in Lydenburg South Africa In 1914 he obtained a commission in the Navy and was surgeon in it until the end of the war, after which, in 1920, he rejoined his sister, who was then in practice in Ayr He became a member of the British Medical Association in the same year Dr McVea was very skilful in the building of model ships, and exhibited one vessel of the Armada period in the Empire Exhibition at Bellahouston, it is now in the Palace of Engineering He was a member of the Ayr Amateur Photographic Society, a keen shot and angler, and had a wide circle of professional and lay friends He is survived by his mother and sister

Dr ALFRED ERNEST WILSON HIRD a former member of Birmingham City Council, died recently at his home in Hagley Road and a memoir appeared in the *Birmingham Post* of June 28 The son of a Coventry practitioner, Dr Hird was born at Edinburgh in 1887 He was educated at Cambridge and Birmingham Universities, and after qualifying M R C S, L R C P in 1908 became house-surgeon at the Birmingham General Hospital under Sir Gilbert Barling From 1909 to 1910 he was house-surgeon to the gynaecological department and was awarded the senior gynaecological prize In 1911 he was appointed a junior medical officer to the Birmingham Education Committee and was visiting surgical casualty officer to the General Hospital from 1912 to 1914

He was mobilized on August 2 1914 and served in naval hospital ships and naval hospitals until February 1919 He was mentioned for valuable services rendered during these years and received the R N V R Officers Decoration Dr Hird was promoted surgeon commander R N V R in 1925 and surgeon captain in 1933 the year in which he retired Immediately after the war he was appointed one of the assistant visiting anæsthetists to Queen's Hospital, Birmingham

Dr GEORGE ANTHONY ZELLER superintendent of the State Asylum at Peoria Illinois (1898–1935) and one of America's leading alienists died of heart disease on June 29 at the age of 79

Known as the Father of French Dermatology Dr JEAN DARIER of the Saint Louis Hospital in Paris has just died at a ripe old age and after retirement from medical practice Though his birthplace was Geneva he spent most of his life in France where he acquired many honours including membership of the French Academy of Medicine His best-known work was his *Précis de Dermatologie* Behind a rather cold exterior he hid a warm heart and a great capacity for enthusiasm and kindly feeling particularly for his juniors As a histologist and dermatologist he made important contributions to the pathology of syphilis cancer and tuberculosis and his name is particularly associated with the condition of keratosis follicularis Dr Darier, who was 82 also had the distinction of being an Honorary Fellow of the Royal Society of Medicine

The death is announced of Dr GABRIEL POUCHET professor of pharmacology and materia medica since 1892 at the Paris Faculty of Medicine Vice president of the *Conseil Supérieur d'Hygiène de France* and member since 1898 of the Academy of Medicine he made important contributions to toxicology and forensic medicine and shortly before his death at the age of 87 he was still physically and mentally alert

Dr SIGURD HAGEN professor of ophthalmology at the University of Oslo, died on May 12 of a hypernephroma discovered by accident last September when he underwent a radiological examination for pain in one shoulder Among his most important works was a study of the post-operative serous detachment of the choroid and an experimental investigation of the secretion and regeneration of the aqueous humour

The following well known foreign medical men have recently died Dr JOHN JACOB ABEL emeritus professor of pharmacology at Johns Hopkins University School of Medicine Baltimore founder and editor from 1909 to 1932 of the *Journal of Pharmacology and Experimental Therapeutics* and president of the American Association for the Advancement of Science in 1932 on May 26 aged 81 Dr ALLEN BUCKNER KANAVEL professor of surgery at the North Western University Medical School Chicago, editor of *Surgery Gynecology and Obstetrics* and author of a well known book on infections of the hand aged 63 Professor WILHELM KNOEBFELMACHER an eminent paediatrist of Vienna, aged 72, and Dr LUIS TAMINI professor of orthopaedic surgery at the Buenos Aires Faculty of Medicine, aged 56

On the site where she worked for eighteen years (1907–25) at Salisbury Street Lisson Grove a memorial has been established to Dr Christine Murrell It consists of a Medical Unit attached to the new Portman Day Nursery of the St Marylebone Health Society opened this week by Viscount Stonehaven The memorial is a tribute to Dr Murrell's pioneer medical work in connexion with infant welfare

Medical Notes in Parliament

Progress of Bills

The Mental Deficiency Bill passed through the committee stage in the House of Lords on July 7 without discussion or amendment

In the House of Lords on July 12 the Green Belt (London and Home Counties) Bill was read a second time The Registration of Stillbirths (Scotland) Bill passed through Committee

The Protection of Animals (No 2) Bill was also read a second time in the House of Commons on July 5 The following day the House agreed to the amendments made by the House of Lords in the Children and Young Persons Bill

The Rating and Valuation (Air Raid Works) Bill which was introduced by Dr Elliot on July 7 exempts from rating structures and structural alterations made by way of precaution against air raid damage The Bill is a complement to the provision in the Finance Bill whereby such works are being exempted from liability to income tax Mr Colville presented a Scottish Bill for the same purpose as Dr Elliot's

The Commons agreed on July 7 to the Lords amendment in the Baking Industry (Hours of Work) Bill

In the House of Commons on July 12 the committee stage of the Finance Bill was concluded The Milk (Extension and Amendment) Bill and the Food and Drugs Bill passed through committee

The Divorce and Nullity of Marriage (Scotland) Bill was taken on Report by the House of Commons on July 12 Debate arose on an amendment by Miss Horsbrugh to delete lunacy for five years from the grounds of divorce The amendment was defeated by 158 to 31 A subsequent proposal was to delete Nullity of Marriage from the title of the Bill

Cardiazol in Treatment of Schizophrenia

On July 5 Mr SORENSEN asked the Minister of Health whether his attention had been drawn to the cure of schizophrenia by cardiazol injections and whether this cure was being applied in all public mental hospitals Mr BERNAYS said this treatment had already been investigated by two medical commissioners of the Board of Control and their report was in preparation The treatment which was still in the developmental stage was being applied in a considerable number of public mental hospitals but information was not available on the number of cases cured thereby

Interdepartmental Committee on Abortion

Dr ELLIOT told Sir Arnold Wilson on July 7 that the interdepartmental committee on abortion under the chairmanship of Mr Norman Birkett K C recently completed the hearing of evidence They were engaged in considering the evidence and hoped to be in a position to present a report before the end of the year It would be premature to decide at present that the evidence should be published with the report

Refugee Doctors and Dentists

Sir SAMUEL HOARE replying on July 7 to Sir Philip Dawson said that as regards doctors dentists and oculists admitted into the United Kingdom from Germany and Austria no separate figures were available for the year 1937 Since 1933 the number of refugee doctors (including oculists) and dentists coming from Germany who had been given permission to practise their profession after admission to the British *Medical* and *Dental Registers* was 185 and ninety three respectively

Expert Advice in Forensic Medicine

Sir SAMUEL HOARE in an answer to Mr Dobbie on July 7 said the services of two analysts appointed by and receiving retaining fees from the Home Office were available to the police and coroners if they had occasion to consult them In

such cases they were remunerated in accordance with a scale of fees approved by the Treasury In addition forensic science laboratories had been established in London and certain other centres with whole time scientific staff remunerated by salary In other cases the police could seek the assistance of other experts, who would be remunerated by fee In every case the function of the expert was to give an opinion as a scientist on the material submitted to him and he did so on his own responsibility The responsibility for the prosecution rested with the Director of Public Prosecutions or with the police

Holidays with Pay

The Holidays with Pay Bill introduced by Mr Ernest Brown was down for second reading on July 14 This Bill empowers Trade Boards Agricultural Wages Committees both in England and Wales and Scotland and the Road Haulage Central Wages Board (to be set up under the Bill at present before Parliament) to direct that any workers whose wages they regulate shall be granted holidays The duration of holidays is to be related to the period of employment with an employer In the case of Trade Boards and Agricultural Wages Committees holidays so granted cannot exceed a maximum of seven days in the year, and in the case of Agricultural Wages Committees there is a restriction that only three of these days can be required to be taken consecutively Otherwise the times periods and circumstances in which holidays shall be allowed are left for settlement by the wage regulating authority

Family Allowances in the House of Lords

The BISHOP OF WINCHESTER moved in the House of Lords on July 7 that a committee be appointed to report on proposals for a national policy of family allowances He said that a number of children were deprived of many necessities of life To the employed labourer with a family there should be extended the policy already in operation for the unemployed man who was given an additional allowance for every child that he had

Lord ASTOR said the last report of the Chief Medical Officer of the Board of Education on the health of the school child emphasized the fact that there was a problem of malnutrition Lord TEMPLEMORE said that in the view of the Government there were at least five lines of approach to this subject These were a general increase of wages, the grant of family allowances by employers to those workpeople who had large families, the formation of pooled funds for the same purpose in the different industries, the creation of a National Family Allowances Fund out of the contributions of employers workpeople, and the Exchequer, and finally the direct provision of family allowances out of the Exchequer Opinion was not yet fully formed and the Government did not think the stage had been reached when it would be useful to set up a formal body to examine the subject

The Bishop of Winchester withdrew his motion

Research into Poultry Diseases

In the House of Commons on July 11 Mr W S MORRISON explained the Government's policy with regard to eggs and poultry He said the Government accepted the view of the Poultry Technical Committee that one of the vital factors affecting the prosperity of the industry in Great Britain was the high incidence of mortality in poultry flocks The Government were impressed by the Committee's views on the urgent nature of the disease problem in the industry They therefore proposed that a Poultry Commission for Great Britain should be set up with the responsibility of conducting a stock-improvement scheme on voluntary lines and with power to control the distribution of breeding stock The Government was also prepared to facilitate the establishment of a research station for the investigation of the major disease problems of the industry and to give sympathetic consideration to a scheme which the Commission would be asked to prepare for the establishment of a progeny-testing station with a view to the production of the highest quality foundation stock The proposal for a poultry research station was already under consideration by the Agricultural Research Council Legislation to give effect to these and other proposals would be introduced

Living Conditions in Mercantile Marine Service

The vote for Mercantile Marine services was debated by the House of Commons on July 8 Mr GRENWOOD moved to reduce it He said that despite improvements made during the last few years conditions for life and service in the mercantile marine were unsatisfactory, particularly in the coastal service

Mr OWEN EVANS said it was a common practice of British shipowners to instruct that their ships were not to be heated when in port In some ships there was no hot water and no running water for anybody Sailors quarters and bed linen should be kept clean by someone whose job on board ship that was and not by the sailors themselves Commander FLETCHER said that the medical officer of the port of Hull reported that in the majority of the ships entering Hull the crew accommodation was in the opinion of a sanitarian quite unsuited for human habitation Lady ASTOR stated that this medical officer's survey had extended over 1 800 ships half of them British The new regulations did not affect the old ships in many of which the conditions of the crews quarters was far worse than any conditions in the slums of London Good shipowners said that when conditions were improved the crews responded in a remarkable way Commander MARSDEN said the medical officer of the port of Manchester reported striking advances during 1937 in the hygiene and amenities of crew spaces

Mr OLIVER STANLEY said no attempt had been made during the debate to criticize the instructions issued with regard to new ships His inspectors were instructed last autumn to make every effort when they noticed the need and possibility of alteration in an old ship to get it made by co operation with the shipowner As a result substantial improvements had been made in a number of ships He received monthly reports on this work

The motion to reduce the Vote was deferred

Drug Traffic in China

On July 11 Mr BUTLER told Mr McEntee that he could not say whether there had been an increase in the sale of dangerous drugs in the International Settlement at Shanghai Of the opium seized during 1937 consignments came from both North and South China, while the heroin was thought to have come mainly from the North Replying to Mr Banfield Mr BUTLER said that during 1937, 255 persons were arrested by the police force of the International Settlement at Shanghai for being concerned in the sale of opium and narcotic drugs Of these 144 were Chinese 97 Koreans 13 Japanese and 1 Latvian On the same day Sir ERNEST GRAHAM-LITTLE asked whether the British Government would obtain an official report from British representatives in Manchukuo as to the extent to which traffic in narcotics was being stimulated and whether there was any record of the Chinese and Manchukuo ports of the quantity and value of dangerous drugs imported as well as any indication of the source of origin

Mr BUTLER said he would consider the suggestion of a report The quantity and value of opium imported into Manchukuo as well as the countries of origin were published in the annual Customs reports No similar figures were available in the case of China

Silicosis in Lancashire and Cheshire

Sir SAMUEL HOARE replying to Mr Gordon Macdonald on July 11 said the Silicosis Medical Board granted eight certificates in 1937 to workmen last employed in coal mines in Lancashire and Cheshire 4 in 1936 3 in 1935 3 in 1934 and 4 in 1933 The inclusion of mines elsewhere than in South

Wales was not contemplated as part of the investigation into lung conditions among coal miners at present being carried out by the Committee of the Medical Research Council their method in this instance being to make an intensive study in a selected locality rather than a general survey The value of the findings however would not be restricted to the sample area from which the evidence was drawn

Mr MARSHALL asked whether in view of the great difficulty in establishing claims under the Silicosis Regulations especially in the grinding trades the Home Secretary would give an undertaking to bring in early legislation to remedy these grave difficulties. Sir SAMUEL HOARE said that question did not arise

Mr GRENFELL asked the Home Secretary to consider making a submission to the Medical Board for a revision of the diagnosis because there was failure to obtain an award in a large number of cases of persons who died from this disease Sir Samuel Hoare said that that also was a more general question than that on the order paper but he would take into account what Mr Grenfell had said

Maternity and Child Welfare Clinics

On July 12 Mr ACLAND asked how many local authorities established clinics according to the permission given to them under Circular 1622 and whether any steps were taken or contemplated to increase the number Dr ELLIOT said that of the 365 welfare authorities in England to which this circular was addressed, 347 had ante natal clinics and twelve others had arrangements for ante natal supervision by means of a domiciliary general practitioner service Authorities having post natal clinics or special arrangements for post natal cases to attend at ante natal clinics numbered 236 133 authorities had special ante natal consultative clinics and 159 had special gynaecological clinics His Department had followed up the circular by correspondence with the local authorities of areas in which according to his information the existing provision needed to be supplemented

Administration of Analgesics by Midwives—Dr ELLIOT told Dr Summerskill on June 23 that in the information which he would ask from local authorities for this year's Annual Return would be the number of local authorities who had arranged for the midwives in their employ to have special instruction in order that they might unaided give their patients analgesia He would also ask how many local authorities availed themselves of the powers conferred upon them to provide the necessary apparatus for their midwives in order that analgesia may be available for women at their confinements

Premature Death Registration—Colonel BURTON asked what were the circumstances under which a certain Mrs Martha Brabben obtained a certificate of the death of Mr James Alfred Douthitt of Hamilton Street Camden Town registered his death and caused arrangements to be made for his funeral when in fact he was still alive Dr ELLIOT replied on July 1 that Mrs Brabben Mr Douthitt's landlady seeing Mr Douthitt lying motionless came to the mistaken conclusion that he was dead In this belief she informed Mr Douthitt's medical attendant, who being acquainted with Mr Douthitt's medical condition issued a certificate of cause of death Mrs Brabben then took steps for the registration of the death and since she was a fully qualified informant in her capacity as the occupier of the house in which to her knowledge the death took-place the registrar duly registered the death upon her information Mr Douthitt proved to be alive on Mrs Brabben's return home

Women Medical Inspectors for Insured Persons—Mr GRAHAM WHITE asked on July 7 how many women medical officers were available in the north western divisional area when women members of approved societies were obliged to submit themselves under the rules of their societies Dr ELLIOT said there was one woman medical officer available in the north western divisional area for the examination of cases

Mr White asserted that on one recent occasion it was impossible to secure the attendance of a woman medical officer while Mrs TATE and Lady ASTOR suggested that the difficulty arose because medical women had to give up their posts on marriage Dr ELLIOT said that in fact there were only six demands from the north west area to see a woman medical inspector

Nutritional State of School Children—School medical officers' annual reports for all areas in England and Wales include statistics of the assessment of the nutrition of children examined at routine medical inspection during the year 1937 In 260 out of the 315 areas some children are shown to be suffering from bad nutrition but in many cases the number is very small often only one or two out of several thousand children examined and the total number of such children represents 0·6 per cent of the number examined In addition 10·7 per cent are shown to have slightly subnormal nutrition These figures were given by Mr Kenneth Lindsay on July 7

Supply of Gas Respirators—Mr LLOYD replying to Mr Perkins on July 12 said he was aware that gas respirators were being offered for sale but no such respirator had been approved by the Home Office unless it bore the Home Office certification mark It was the Government's policy to supply respirators for the whole of the civilian population free of charge

Notes in Brief

The Minister of Health anticipates that it will be possible to publish his report which relates to the financial year ended March 31 1938 in about four weeks Asked to arrange for earlier publication Dr ELLIOT points out that the report is based to a large extent on statistical information which has to be obtained from local authorities and analysed in the Department

Mr Wedderburn stated on June 20 that in Scotland there were two deaths from the effects of vaccination in 1927 one in 1928 one in 1930 and one in 1931 Two deaths from small pox occurred in 1930 No deaths from either cause occurred in Scotland between 1931 and 1936 the latest year for which figures were available

A member of the staff of the Medical Research Council is giving his whole time to the investigation of infantile paralysis and cognate diseases

Colonel Colville hopes to make a statement before the end of the session on the Government's intentions with regard to the recommendations of the Gilmour Committee on the reorganization of Scottish offices

The number of patients who on April 1 1938 were receiving treatment in residential institutions under the schemes of local authorities in England and Wales for the institutional treatment of tuberculosis was 27,968 The number of persons who had been awaiting such treatment for more than ten days was 1,798

The full cost of the Joint Council of Midwifery nutrition scheme for expectant mothers from January 1937 to March 31 1938 has been met from the amount of £8,500 granted by the Commissioner for the Special Areas Before January 1937, the cost was defrayed out of voluntary contributions

Of 257 cases of tuberculosis notified in single apartment houses in Glasgow during 1937 190 were in overcrowded houses

The average *per capita* consumption of liquid milk in Great Britain during the year ended May 31 1936 the latest period in respect of which adequate information is available is estimated to have been two-fifths of a pint daily

Mr W S MORRISON states that during the period of three months following the date on which Part IV of the Agriculture Act 1937 came into operation—namely, April 1 1938—payments totalling £4,085 were made out of the Diseases of Animals Account to cattle owners in respect of assistance under the tuberculosis (attested herds) schemes towards the cost of tuberculin tests with a view to eradicating tuberculosis from the herds concerned

INFECTIOUS DISEASES AND VITAL STATISTICS

No 26

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended July 2 1938

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for (a) England and Wales (London included) (b) London (administrative county) (c) Scotland (d) Eire (e) Northern Ireland Median values for the last 9 years for (a) and (b)

Figures of Births and Deaths, and of Deaths recorded under each infectious disease are for (a) The 126 great towns (124 in 1937) in England and Wales (including London) (b) London (administrative county) (c) The 16 principal towns in Scotland (d) The 13 *principal towns in Eire* (e) *The 10 principal towns (9 in 1937) in Northern Ireland*

A dash — denotes no cases a blank space denotes disease not notifiable or no return available

Disease	1938					1937 (Corresponding Week)					1929-37 (Median Value Corresponding Weeks)	
	(a)	(b)	(c)	(d)	(e)	(a)	(b)	(c)	(d)	(e)	(a)	(b)

* After October 1 1937 puerperal fever was made notifiable only in the administrative county of London

† Deaths from puerperal sepsis

‡ Includes primary form in figures for England and Wales, London (administrative county) and Northern Ireland

EPIDEMIOLOGICAL NOTES*

Enteric Fever

During the week under review 26 cases of enteric fever were notified in England and Wales compared with 20 in the previous week of these 5 (0) were in London—2 each in Battersea and St Marylebone and 1 in St Pancras In Scotland 3 cases of typhoid fever were recorded—1 each in Glasgow Greenock and Paisley

Diphtheria and Scarlet Fever

Notifications of diphtheria in England and Wales fell from 989 to 943 in the week under review and in London from 146 to 140 There was also a marked drop in the notifications for Scotland—176 as against 191—and for Northern Ireland a slight decrease—21 as against 22 but in Eire there was a rise from 41 to 44 Deaths from diphtheria in the 126 Great Towns of England and Wales remained at 22 while in London they fell from 4 to 2 Of the 22 deaths recorded in the 126 Great Towns 2 each occurred in Chester (0) Liverpool (2) Manchester (1) Newport (0) There were 5 deaths from diphtheria in the 16 principal towns of Scotland during the week under review—3 (4) in Glasgow and 1 each in Dundee (0) and Aberdeen (0) There was a decrease in the number of notifications of scarlet fever in England and Wales during the week—1 641 as against 1 765—and in London where 152 cases were recorded compared with 171 in the previous week In England and Wales the figures were slightly in excess of the median value for the last nine years but in London they were considerably less There were two deaths from scarlet fever in the 126 Great Towns of England and Wales during the week under review compared with 3 in the previous week of these 1 (1) occurred in London Notifications in Scotland rose from 355 to 361 with 1 death and in Eire from 79 to 98 but in Northern Ireland they remained at 78

Primary and Influenzal Pneumonia

Notifications of primary and influenzal pneumonia in England and Wales fell from 758 to 622 during the week under review and in London from 76 to 45 the figure for England and Wales is well above the median value for the last nine years while that for London is below it There were 17 deaths from influenza in the 126 Great Towns of England and Wales compared with 20 in the previous week in London the number of deaths from influenza rose from 2 to 3 In the West Riding (Yorks) 82 (103) cases were notified of which 20 (53) were in Sheffield 25 (25) in the Administrative County 14 (20) in Leeds In Warwickshire 35 (39) cases were notified of which 25 (24) were in Birmingham and 6 (10) in the Administrative County Of the 118 (136) cases reported in Lancashire 30 (37) occurred in Liverpool 18 (37) in Manchester 21 (25) in the Administrative County Of the 17 deaths from influenza recorded in the 126 Great Towns of England and Wales during the week 3 (2) were in London and 2 each in Portsmouth (0) and Cardiff (0) In Scotland 178 cases of primary pneumonia were notified compared with 192 in the previous week while there were 12 cases of influenzal pneumonia—compared with 5 in the previous week—with no deaths In Eire there were 9 (11) cases of primary pneumonia and 6 (7) deaths 4 (6) of which were in Dublin There were 13 (14) deaths from pneumonia in the ten principal towns of Northern Ireland during the week—9 (11) in Belfast 3 (0) in Londonderry and 1 (1) in Larne

Measles and Whooping-cough

In the 126 Great Towns there were 8 deaths from measles during the week under review compared with 10 in the previous week of these 3 (1) occurred in London 2 (0) in Newcastle upon Tyne and 1 each in Barnsley (1) Sunderland (0) Stoke on Trent (0) During the week 348 cases were reported from the L C C elementary schools compared with 422 in the previous week The average daily admissions to the L C C fever hospitals were 18 the same as last week and the number of cases of measles under treatment in these hospitals on Friday July 1 was 724 compared with 860 on June 24 On the same day there were under treatment in the L C C fever hospitals 918 (940) cases of diphtheria 682 (761) cases of scarlet fever 252 (263) cases of whooping-cough Notifications for the week ended July 2 in the eleven metropolitan boroughs in which measles is notifiable were 164 (241) distributed as follows Battersea 18 (34) Bermondsey 6 (11) Finsbury 8 (16) Fulham 10 (27) Greenwich 63 (47) Hampstead 6 (11) Lambeth 17 (36) St Pancras 15 (33) Shoreditch 6 (5) Southwark 10 (13) Stepney 5 (8) In Scotland 113 cases of measles were notified compared with 173 in the previous week the figures for Kirkcaldy were 35 (19) for Glasgow (7) and Falkirk (28) 17 each for Dundee 13 (22) for Lanark County 9 (21) and for Edinburgh 7 (8) During the week there were 3 deaths from measles in the 16 principal towns of Scotland—1 each in Glasgow Edinburgh and Dundee In Eire there was 1 death from measles occurring in Dublin and none in Northern Ireland Of the 6 cases of measles reported in Northern Ireland 5 were in Warrenpoint and 1 in Lisnaskea

In England and Wales there were 13 (18) deaths from whooping cough during the week of which 3 (2) occurred in London In Scotland 97 cases of whooping cough were notified compared with 123 in the previous week while there were 3 deaths—2 (0) in Kilmarnock and 1 (1) in Glasgow In Northern Ireland 13 (22) cases of whooping-cough were recorded with 1 death

Cholera

During the week ended July 2 301 cases of cholera were reported at Shanghai and 25 cases with 14 deaths in Hong Kong In the same week in Burma 8 cases with 6 deaths were notified in Calcutta 41 cases with 18 deaths in Bombay (Presidency) 63 cases with 27 deaths in Delhi 3 cases with 1 death In the Central Provinces 1 034 cases with 505 deaths were reported during the week under review in the North West Frontier Province 149 cases with 73 deaths in Madras (Presidency) 287 cases with 111 deaths in the Punjab 112 cases with 54 deaths in Sind 16 cases with 11 deaths and in the United Provinces 7 cases with 2 deaths in Allahabad and 3 cases with 2 deaths in Cawnpore In French Indo-China during the same week 117 cases of cholera were notified in Annam 177 in Tonking and 3 in Hanoi

Plague

During the week ended July 2 17 cases of plague with 10 deaths were reported in Burma In British India in the same week 5 cases with 4 deaths were notified in Bombay (Presidency) and 2 cases with 1 death in Madras (Presidency)

Small pox

During the week ended July 2 there was 1 case each of small pox reported in Shanghai and Hong Kong In the same week in Burma 8 cases were notified in British India 22 cases with 9 deaths were reported in Calcutta 172 cases with 29 deaths in Bombay (Presidency) 37 cases with 9 deaths in the Central Provinces 36 cases with 12 deaths in Madras (Presidency) 28 cases with 10 deaths in the North West Frontier Province 62 cases with 9 deaths in Sind In the same week in French Indo China there were 23 cases of small pox in Tonking During the week ended June 25 225 cases were reported in the U S A

Typhus

During the week ended July 2 in Egypt 1 case of typhus was reported in Alexandria 2 cases in Cairo and 65 cases in the Provinces In the previous week 71 cases with 6 deaths were notified in Morocco mainly distributed as follows Chaouia 17 cases 3 deaths Marrakesh 13 cases, Dukkala 8 cases Casablanca 7 cases 1 death 5 each in Fez (1 death) Rabat and Oued Zem In the same week in Tunisia 76 cases of

* Except where otherwise mentioned figures in parentheses refer to the week preceding the one under review

typhus were recorded mainly distributed as follows Suk-el Arba 14 cases Southern Territories and Susa 12 each, and 4 each at Le Kef, Medjez-el Bab and Teboursuk During the week ended June 18 in Algeria 70 cases were notified distributed by departments as follows Constantine 54 Southern Territories 10, Algiers 6 In Poland during the same week 44 cases with 2 deaths were reported, mainly distributed by departments as follows 7 cases each in Lwow and Nowogrodek Wolhynia 6 cases, Wilno 5 cases, and 3 each in Cracow and Polesia In the U S A during the week ended June 11 there were 34 cases of typhus Georgia 16 Alabama 7, Florida 5, Texas 3 and 1 each in Connecticut, Louisiana, and Maryland

Universities and Colleges

UNIVERSITY OF BRISTOL

The Beaverbrook Fellowship has been awarded to Beryl D Corner, M D

UNIVERSITY OF LIVERPOOL

On July 5 the Council of the University reappointed Professor W H Wood M D Dean of the Faculty of Medicine

UNIVERSITY OF MANCHESTER

ROYAL COLLEGE OF SURGEONS OF ENGLAND

Election to the Council

Four Fellows were elected on July 7 into the Council to fill the vacancies caused by the retirement in rotation of Mr Victor Bonney Mr R C Elmslie, and Sir William Girling Ball and by the resignation of Mr C H Fagge The result of the poll was as follows

	Votes
REGINALD CHEYNE ELMSLIE (St Bartholomew's)	667
WILLIAM FRANCIS VICTOR BONNEY (Middlesex)	658
SIR WILLIAM GIRLING BALL (St Bartholomew's)	657
LIONEL EDWARD CLOSE NORBURY (Royal Free)	502
Vincent Zachary Cope (St Mary's)	410
Robert Joseph Willan (Newcastle upon Tyne)	395
Robert Davies Colley (Guy's)	356
Sir Lancelot Edward Barrington Ward (Great Ormond Street)	349
Julian Taylor (University College Hospital)	297
Walter Goldie Howarth (St Thomas's)	217

In all 1358 Fellows voted, in addition ten votes were found to be invalid Mr Bonney Mr Elmslie, and Sir William Girling Ball are all elected for the full period of eight years and Mr Norbury acts as substitute member for Mr Fagge until July, 1945

COMBINED HOSPITALS UNIVERSITY ENTRANCE SCHOLARSHIPS

The following awards have been made

St Bartholomew's Hospital Medical College D S Cadman St John's College, Cambridge (Scholarship), J N Milnes St John's College Cambridge (Exhibition)

Guy's Hospital Medical School N Gillman Downing College Cambridge (Scholarship) H E S Marshall, Downing College Cambridge (Exhibition)

St Thomas's Hospital Medical School J R Tiller Worcester College Oxford (Scholarship) L H H May, Trinity College Cambridge (Exhibition)

The Services

48TH AND 61ST (S M) DIVISIONS R A M C

Colonel RALPH A BRODERICK A D M S, 48th (South Midland) Division R A M C T A writes I am very anxious to promote a reunion of all old comrades of the above R A M C units who served in these Divisions during the great war I would suggest that a reunion dinner be held in Birmingham in the late autumn of this year under the auspices of the Birmingham Branch of the R A M C Association, and I trust that you will publish this letter so that the attention of your readers may be called to the project Will all who are interested and served in the corps during that period communicate with Lieutenant Stanford, R A M C, T A at Stockfield Hall, Acock's Green, Birmingham, 27?

Surgeon Commander S H Facey, R N (ret), has been awarded a Greenwich Hospital pension of £50 a year in the vacancy caused by the death of Surgeon Captain Sir Arthur Nance, K B E, C B, R N (ret)

DEATHS IN THE SERVICES

Major THOMAS HERBERT DICKSON R A M C (ret) died at Tangier, Morocco on June 17, aged 54 He was born on December 7, 1883, the youngest son of the late Reverend T C Dickson of Argyle Place Church, Edinburgh and was educated at Edinburgh University, where he graduated M B, Ch B in 1906 After filling the posts of junior and assistant medical officers at the North Riding Asylum, York, and of senior house surgeon at the Royal Sea Bathing Hospital Margate he entered the Royal Army Medical Corps as lieutenant on July 31 1909 became major in 1921, and retired on July 31, 1929

Medical News

Mr H L Eason Principal of the University of London has been elected an Honorary Master of the Bench of the Inner Temple

On the afternoon of Tuesday July 26 Dr Walter Elliot Minister of Health will open the new County Infirmary at Louth the ceremony being presided over by Lord Heneage chairman of the Lindsey County Council

An International Plastic Surgery Congress will be held at the Sarfatti Institute in Milan on September 25 26 and 27 Surgeons and specialists from England Germany France Scandinavia Holland and North America have announced their intention of attending the meeting. One of the principal subjects to be discussed is the eradication of malignant facial growths

The twenty fifth French Congress of Medicine will be held at Marseilles under the presidency of Professor Olmer from September 26 to 28 when the following subjects will be discussed icterogenic spirochaetosis hypochloraemia and the present treatment of avitaminosis in the adult Further information can be obtained from the general secretary Professor Roger 66 Boulevard Notre Dame Marseilles

The fifth congress of the Latin Medical Press will be held at Lisbon from September 29 to October 2 under the presidency of Professor Reynaldo dos Santos The subjects for discussion will be medical bibliography and the copyright of articles Further information can be obtained from the general secretary Professor Armando Narciso Restauradores 48 Lisbon

The third international congress for microbiology will be held in New York from September 2 to 9 1939

The introductory address before the Middlesex Hospital Medical School will be given on Tuesday July 26, at 3 p m at the Queen's Hall Langham Place by Mr W Warwick James F R C S dental surgeon to the hospital and the prizes gained during the academic year will be distributed by Sir Edward Meyerstein

The Child Guidance Council (Woburn House Upper Woburn Place W C) has awarded Fellowships in Psychiatry to Allan G Crisp M D Kenneth Soddy M B D P M and Rosalind Vacher M B D P M The fellowships are of the value of £300 and are tenable for a year from October for half time work at the London Child Guidance Clinic 1 Canonbury Place Islington N

The Ministry of Health has sanctioned a loan of £253 000 for the first instalment of Southend's municipal hospital extension

The King has appointed Dr Christopher James Wilson to be an unofficial member of the Legislative Council of the Colony of Kenya

QUERIES AND ANSWERS

Cockroaches

F P" has asked us for the name of the vendors of a preparation called zonol used for the extermination of cockroaches (blackbeetles) It can be obtained from any branch of Messrs Boots We take this opportunity of referring E P (and others similarly afflicted) to the pamphlet entitled *The Cockroach Its Life History and How to Deal with It* by Frederick Laing M A B Sc published in 1921 in the Economic Series (No 12) by the British Museum (Natural History) Cromwell Road London S W 7 at 6d per copy (postage 1d)

Mosquito Bites

B B L writes from Scotland in answer to B S s inquiry (May 28 p 1192) I have found flygo —a Dubarry preparation—unequalled Its only disadvantage is that it does not keep well as it is liable to shrink when it has been lying a long time in a chemist's shop Oil of lavender, I found *attracted* mosquitos

Income Tax

Professional Use of Cars

TAXPAYER has for many years used two cars in his practice The local inspector of taxes has now objected to an allowance for more than one car and even then claims to deduct 10 per cent of the expense of one car as representing private use

We cannot see the grounds for the inspector's contention The question is one of fact If Taxpayer uses two cars professionally he is entitled to the running costs depreciation obsolescence etc of both less a reasonable percentage to cover the ratio of private use of both cars If he were liable to assessment under Schedule E the position might be different because the inspector could then contend that the use of two cars was not necessary But as regards an assessment under Schedule D that criticism is not appropriate The inspector seems to us to be no more entitled to object to the expense of two cars than he would be entitled to say that a tradesman is employing too many assistants and that he will only allow the wages of half of them

Expenditure on Apparatus and Books

X Y has spent an abnormal amount recently on apparatus is it advisable to claim "depreciation on such equipment? The inspector of taxes has informed him that no allowance

is due for additions to the medical library as distinct from periodicals or renewals Is this so?

*** The depreciation allowance is for "plant and machinery and surgical instruments fall under the category of 'tools' rather than plant Consequently depreciation on comparatively small and portable apparatus cannot legally be claimed but as the various instruments etc, become worn out or are discarded as obsolete and renewed the cost of replacement can be claimed as a professional expense The same principle applies to books Where a textbook becomes out of date and is replaced by a later book on the same subject the cost can be deducted for income tax purposes

LETTERS, NOTES, ETC

Nasal Sinusitis in Childhood

MR J BERNSTEIN (Liverpool) writes May I be allowed to reply to various points in Mr Frank Coke's letter in the *Journal* of June 11 (p 1285) In my opinion there is a definite condition in which there is thickening of the mucosa of the sinuses with the presence of mucoid fluid and this is due to the allergic state The mucosa of the nasal sinuses is continuous with that of the nose and participates in similar infections and conditions Why therefore, should the allergic phenomenon which admittedly takes place in the nose not extend to the sinuses? For my own part, I find that group testing will give me almost as much information as individual testing and without putting the patient to the inconvenience of a number of sittings I have also found, and I think that many others are in agreement that a particular protein may often give a negative skin reaction and yet be allergic to the patient That is the reason why I eliminate, at the beginning the proteins which I have found to be the most common offenders As the patient improves he is gradually restored to a normal diet by the method of trial and error As to vaccines and infection I think that often the organisms found are merely the result of the predisposing allergic condition and not the cause Because of the unhealthy condition of the mucosa the organisms are not destroyed but proliferate Vaccines may help but in my opinion they do not attack the fundamental cause and I think that is the only point of difference between Mr Coke and myself

Appendicitis and Heavy Meat Diet

MR MORTON WHITBY (London) writes Dr A Forbes Brown's experiences described in the *Journal* of June 25 (p 1390) regarding appendicitis in Uganda coincide with my own when I was Assistant Colonial Surgeon in the Falkland Islands and, later, surgeon and radiologist to Mackenzie Hospital British Guiana Falkland Islanders are mostly Scotsmen and Englishmen, and are compelled owing to the lack of fresh vegetables to live on large quantities of meat, mostly mutton Out of every 100 operations among the inhabitants in 1925 80 were performed for appendicitis The British Guiana native population in the Bush seventy-five miles up the Demerara River, are almost entirely free from appendicitis In 1926 out of 1,000 operations there was only one case of this condition, and the patient died from malaria on the day I had prepared to operate on him A post mortem examination revealed an acute gangrenous appendix, apart from his acute malarial cachexia The patient had been a meat-eater while working for Europeans These two experiences in totally different climates and under different dietetic conditions would strongly suggest that appendicitis owes its origin to a heavy meat diet

Medical Tour to Soviet Russia

MESSRS DAVID BAND NORMAN M DOTT W T MUNRO H M TRAQUAIR and NOEL E WATERFIELD write We would draw your readers attention to the medical tour to the USSR recently advertised in your columns by the Society for Cultural Relations (98 Gower Street WC1) Our visit to the USSR last September was arranged by the SCR and we were thus enabled to make contacts with medical men and to visit medical institutes which we would otherwise have missed The travelling arrangements made for us were excellent Everything worked smoothly, and we had no difficulties with regard to trains and hotels The accommodation was comfortable and the meals excellent and the guides were very friendly and obliging We felt that the trip had been very well worth while from the point of view of gaining knowledge concerning the important medical and social activities of the USSR, and we regard the trip also as a very pleasant holiday The 1938 party will leave London by sea on September 7 and return overland on September 28 the cost being from £28

A Doctor's Collection of Old Medical Books

On July 18 Messrs Sotheby of Bond Street are selling the book collection formed by Dr Cuthbert F Selous of Tunbridge Wells which includes a good many old medical books some of them exceedingly rare Alexis of Piedmont's *Secrets containing excellent remedies against divers diseases* black letter, translated by W Warde and published by R Hall 1562 is in three parts bound together in one volume apparently the other known copy which is in the British Museum has two parts only There are also catalogued two other editions of this book 1580 and 1595 both of them also in black letter Barrough's *Method of Physick* 1624 is the sixth edition of that work which evidently was popular Sir R Blackmore's *Treatise of Consumptions* 1724, and J J Berlu's *Treasury of Drugs unlocked* 1690 precede a copy of Sir William Osler's *Incunabula Medica* Then we come to Boerhaave's *Method of Studying Physick* 1715 J Parsons's *Enquiry into the Nature of Hermaphrodites* 1741, Andrew Boorde's *Breviary of Healthe* 1552, and G Baker's *The Newe Jewell of Health* 1576 which are followed by a long string of the works of that prolific author and earnest researcher Robert Boyle Most of these are not medical, but there are a few which are in this category—for example, *Memoirs for the Natural History of Humane Blood* 1684, *The Reconcileableness of Specifick Medicines to the Corpuscular Hypothesis* 1685, *Medicina Hydrostatica* 1690, and *Medicinal Experiments* 1692 and 1693–4 T Bright's *Treatise of Melancholy* 1586 *Vade Mecum or Companion for a Chyrurgion* by T Brues 1652 R Bunworth's *Physical Discourse exhibiting the Cure of Diseases by Signature* 1656 are followed by a textbook on the cure and prevention of the Plague 1636, and by T Cogan's *Haven of Health* 1612 Culpeper is well represented by a series of books, of which need be quoted only his *Directory for Midwives* 1651 Sir Thos Elyot's *Castel of Helth corrected* 1541, unfortunately is not quite perfect, but a later edition, 1576 is hitherto unrecorded and may well be unique Only two other copies are known (British Museum and Cambridge University) of O Gabelkouer's *Boock of Physicke nuelye translated out of Low duche by A M* Dorte, Iarck Caen, 1599 and C Gesner's *Newe Jewell of Health* 1576, if not quite so rare is at any rate uncommon Another quaint title is that of G Gratarolo's *Direction for the Health of Magistrates and Studentes* Englished by T Newton, 1574 Balneology is the subject of several treatises including T Guidott's *Discourse of Bathe and the Hot Waters there* 1676, Jorden's *Discourse of Naturall Bathes and Minerall Waters* 1633 Tonstall's *Scarborough Spaw Spagyrically Anatomized* 1670 Wittie's *Scarborough Spaw* 1667, and T Venner's *Via recta ad vitam Longam wherunto is annexed Baths of Bathe as also Treatise concerning Tobacco* 1638 There are first editions of T Willis's *Cerebri Anatome* 1664 and *De Anima Brutorum* 1672 as well as others by that author also a copy of William Harvey's *De Generatione Animalium* published at Amsterdam in 1651 the same year as the first edition Langham's *Garden of Health* is represented by the first edition of 1579 and by a later one 1633 Another interesting old book is the *New Mystery in Physick discovered by curing of Fevers and Agues by Quinquina or Jesuites Powder* translated by Dr Belon 1681 There are many other medical books in this collection as well as a large amount of general literature and in a further collection for disposal in the same sale are a few more including another edition of Willis's *De Anima Brutorum nempe Cerebrum et Nervosum Genus afficiunt explicat eorumque Therapeias instituit* Amsterdam 1674, and another copy of the 1692 edition of R Boyle's *Medicinal Experiments*

A little book by Miss J Halford entitled *The Diet for Expectant and Nursing Mothers* is published by the Food Education Society 29 Gordon Square, WC1 post free 3½d It opens with a series of cautions calculated to remove false impressions as to the diet under such conditions These are followed by numerous practical hints

KEY TO CURRENT MEDICAL LITERATURE

GENERAL JOURNALS

Deutsche Medizinische Wochenschrift

Berlin vol 64 May 6 1938

Air Electricity and Treatment of Patients —C Rupprich
New Treatment for Chronic Dysenteric Encephalitis with Parkinsonian Manifestations —G Peregrossi
Remarks on Specific Bulgarian Cure of Chronic Eczema Encephalitis —H D v Wittelsbeten
Intranasal Anæsthesia —K Junkmann
Clinical Experiences with a New Spasmolytic —A Pasquali
A Filter paper Manometer in Flocculation Reaction in Syphilis —K v D Gucht
Visual Acuity of Nomads in Asia Minor —S Irmak
Practical Significance of Trichomonas Leucorrhœa —G Panthel
Occupational Therapy in Curative Institutions in Berlin —I Paucker
High Court Medico-legal Judgments in 1937 —Pasch and Trembur

New Spasmolytic—The antispasmodic action of jucundal (Schering) has been tested on the rabbit's small intestines It is claimed for this drug that it possesses remarkable antispasmodic properties with very low toxicity Its technical as distinct from its trade name is trimethylacetamide

Flocculation Reaction—This test the technique of which is described in detail was applied to 298 non syphilitic patients and 111 syphilitic patients The reaction was negative in all the non syphilitic cases In 107 of the syphilitic cases the reaction tallied with the Wassermann and Meinicke II reactions In two cases it tallied only with the Meinicke II reaction Thus there were only two cases in which the reaction described by Guo was negative in the presence of syphilis

Indian Medical Gazette

Calcutta vol 73 April 1938

Present Position of Opium smoking Habit in India —R N Chopra and G S Chopra
Incidence of Rheumatic Infection in India —V Mangalik and H Stott
Subcutaneous Nodule of Rheumatism —P Golferkeri
Bacteriophage Treatment of Dysentery in Private Patient —M O C none
Herpes Zoster Therapeutic Experiments with Tissue Lysate —P Mukherjee and L Ghosh
Renal Ectopia —V Kaikini
Treatment of Splenomegaly by Milk Injections —C Pasricha and G Chopra
Modified Technique for Phleric Evulsion —R Viswanathan
Typhoid Fever presenting Unusual Features —P Karamchandani and C Mehr
Pseudo-malignant Tumour of Ileo-cæcal Region —M Kini
Case of Jejunal Diverticulosis —V Nath
Case of Breast Cancer in a Male —A Dey
Gastric Cancer in Girl of 19 —A Chandra Dey
Conditioned Reflexes —S Bhatia

Rheumatic Infection—Acute and flagrantly active phases of the disease are conspicuously rare in India The type usually seen is a mild and chronic form with vague pains in joints and tendons Valvular disease of the heart of rheumatic origin seems fairly common when compared with the rarity of other manifestations of rheumatism pericardial involvement is rare The association of infected tonsils with valvular disease is too common to be ignored as an aetiological factor

Herpes Zoster—Forty cases of this disease have been treated with hypodermic injections of tissue lysate prepared from the herpetic vesicles there has been uniform success in relieving pain and lowering the duration of the disease The preparation of the tissue lysate is simple and it would be possible to prepare it on a commercial scale

Splenomegaly—The results of the treatment of a series of 100 patients suffering from splenomegaly not due to kala azar with injections of skimmed sterilized milk are recorded There was a marked reduction in the size of the spleen in approximately 50 per cent of the patients treated Intramuscular injection gave better results than intracutaneous injection.

Journal of the American Medical Association

Chicago vol 110 May 7 1938

Endocrinology and Understanding and Treatment of the Exceptional Child —L S Kinne
Management of Septic Patient with Otitis Media —J H Maxwell
Sulphanilamide in Treatment of Genitourinary Tuberculosis —I Thompson
Sulphanilamide in Treatment of Gonorrhœal Vulvovaginitis —S Hoffman M Schneider M Batt and R D Herrold
Carbon Dioxide Breathing Six Cases —S T Gorby and M Trumper
Treatment of Undulant Fever with Sulphanilamide —R Stern and K Blake
Nerve Effects in Human Beings —C M Cord E Teal and W Wiberding

Klinische Wochenschrift

Berlin vol 17 May 1938

Paradoxical Neutralization of Natural Vasomotor Stimulants —E Weber
Sex Specific Effects of Male Testicular Hormones —W H Veil and O Lippes
Effect on Suprarenals of Prolonged Oral Administration of Small Doses of Cellular Hormone —M Dirnhofer
New Method for Qualitative and Quantitative Determination of Corpus Luteum Hormone —J J Dusyenova and Wit
Acid Cover of Skin and Antibacterial Protection I —A Marchionini and W Hauschecht
Influence of Alarm Reaction and Histamine Therapy on Water Metabolism in Renal Lesions —H Selye
Influence of Strychnine Stimulation on Acetylcholine Control of Nervous System Neutralization of this Substance by Dial —J Feiger H Kowarzyk and Z Lelow Lachowicz
Blood Pressure and Blood Sugar Studies on Rabbits with Grafted Pituitary Glands —E Klin and A von Domanski
Recovery from Embolism of Abdominal Aorta —F Grant
Reticuloendothelial System and Iron Metabolism —G Barkan
Conditions governing Withdrawal of Right to Practise Medicine —H Muller Schoites

Acid Cover of Skin—Measurements of the *p*H of the skin of different parts of the body revealed that the skin is covered with an acid layer formed by sweat the acid reaction preserves the skin against bacterial infection But in some parts of the body the reaction is neutral or even alkaline This is the case in the axillae genito-crural and anal regions interdigital spaces of the feet and some parts of the sole these parts are liable to bacterial or mycotic infection

Lancet

London vol 234 May 7 1938

Surgical Treatment of Detachment of Retina —J Cole Marshall
Diet and Internal Treatment in Skin Diseases —F F Hellier
Anorexia Nervosa with Special Reference to Carbohydrate Metabolism —C W Ross
Peripheral Neuritis associated with Pyloric Stenosis and Vitamin B Deficiency —L P L Laurent and H M Sinclair
Treatment of Bubo with Sulphanilamide —A Hutchison
Hypertrophic Pyloric Stenosis in One of Univitelline Twins —W Shelton

Detached Retina—After describing the modifications which have followed Gonin's employment of cauterization Cole Marshall states that he prefers diathermy coagulation combined with electrolysis for drainage The technique is given in detail Two typical cases are reported the tears and the post operative scars being illustrated

Anorexia Nervosa—A severe case is described in a girl aged 12 the carbohydrate metabolism was investigated in detail Dietetic treatment was effectively supplemented by liver therapy The view of a pituitary causation is not favoured a psychogenic abstinence is thought to be followed by physiological impairment of glucose tolerance a falling alimentary hypoglycæmia and impaired gastric tonicity

Medical Journal of Australia

Sydney vol 1 April 23 1938

Public Health Legislation's Evolution in South Australia —A R Southwood
Concoction of Spirits from Time of Galen onwards —E F Gartrell
Indications for Blood Transfusion —E I Wood
Observations on Morbidity in Tropical and Subtropical Queensland —A H Baldwin
Indications for Interference during Labour —A M Wilson

Medizinische Klinik

Berlin vol 34 May 6 1938

Otitis Externa—H Loebell
Eye Injuries through Accident—Kriepsmann
Menopausal Genital Affections—W Benthin
Backache in Females—W W Bauer
Treatment of Puerperal Infections with Intravenous Animal Carbon—R Kohler
Practical Hints on Diphtheria—K Srnetz
*Treatment of Polycythaemia with Diet Poor in Albumin—J Losch
Tyrometric Estimation of Sugar in Blood Serum Cerebrospinal Fluid and Urine in General Practice—J W Wirtz and H Krelle
Recognition of Malingerers—P Reckzeh
Causation and Diagnosis of Cardiac Infarction—J A M Kimbers

Polycythaemia—By means of a diet practically devoid of animal albumin it was possible to reduce the red blood corpuscles in the different types of polycythaemia by one to two millions during the first week of treatment After not more than two and a half months the red cell count came down to five millions The haemoglobin decreased to 100 to 110 per cent much more slowly The general condition of the patients remained excellent but the spleen was still enlarged and the blood pressure and leucocytic count were unchanged A return to a normal diet gave rise to polycythaemia again but it was possible to keep the condition within bounds by means of a partially restricted diet

Medizinische Welt

Berlin vol 12 May 7 1938

Differential Diagnosis of Inflammatory Phimosis—A Stuhmer
Diagnosis of Diseases of Heart Valves in Adolescents—L Bolzer and H Vogt
Pathology Physiology and Therapy of Headache—K Weidner

Significance of Uckos Reaction and Postprandial Blood Amino-acids in Pulmonary Tuberculosis—A Rubino
*Sulphanilamide Treatment of Acute and Chronic Gonorrhoea in Males—V Tommasi
Glucose Content of Cerebrospinal Fluid in Insulin Shock Therapy of Schizophrenia—M Fischer

Sulphanilamide in Acute and Chronic Gonorrhoea—Tommasi had good results in fifty three acute and thirty chronic cases lavage being sometimes undertaken as well In five of fifty three acute cases streptosil was not tolerated in five others and in four of the thirty chronic cases it was ineffective The importance of abstention from administration of other drugs at the same time is stressed

Presse Medicale

Paris vol 46 May 4 1938

Hypercreatinaemia—L Cornil D Olmer I Dunan and J Vague
Part played by Sympathetic in Trauma of Face and Fractures of Jaw-bones—M Dechaume
Experimental Hyperthermia—M Burstein

Paris vol 46 May 7 1938

*Slow Continuous Intravenous Insulin in Diabetics—A Baudouin J Lewy and E Azérad
Inflammatory Reactions in Pulmonary Tuberculosis—R Bonda and H Mallet
*Vitamin C Exchange between Mother and Foetus—W Neuweiler and J Hubscher

Intravenous Insulin—The authors give an account of their experiences in treating diabetes with continuous intravenous insulin and claim to have obtained satisfactory results especially in severe or complicated cases (coma, operation infection) Their results would also appear to lend support to the view that in some cases at least diabetes is due to a pluriglandular and not merely to a pancreatic deficiency

Foetal Vitamin C—After an elaborate experimental study of the vitamin C exchange between mother and foetus the authors come to the conclusion that the latter behaves as a parasite and draws from the mother the amount of vitamin C necessary for its requirements This of course entails the possibility of vitamin C deficiency in pregnant and nursing women Moreover the milk of cows and goats contains much less vitamin C than human milk (since these animals can build up this vitamin synthetically) so that neither is a satisfactory substitute for human milk as regards the vitamin C content Lemon orange or grapefruit juice or synthetic vitamin C should therefore be given to make up the deficiency

Schweizerische Medizinische Wochenschrift

Basle vol 68 May 7 1938

Spontaneous Fracture in Circumscribed Tuberculosis of Ulna—C H Gra
*Anatomical and Clinical Features of Forked Clavicle and Coraco-clavicular Articulation—C Henschen
Inflammatory Gastric Granuloma—O Mensis and B Gheiew
Physiopathology of Asthenia—L Laruelle

Forked Clavicle and Coraco clavicular Articulation—Henschen describes two cases of true coraco clavicular articulation discovered accidentally and discusses the phylogenetic and ontogenetic origins of such a condition He classifies the pathological changes which are conceivable or have been recorded both in the true articulation and in the ligamentous articulation with bursa formation between the coracoid process and the clavicle

Fight against Diphtheria and Scarlet Fever in Town and Country—J Seel
Nasal Bleeding and Internal Medicine—F Frenkel
Light and Ray Therapy in Skin Diseases in General Practice—J Konrad
Therapy of Gonorrhoea in Females—R Hofstatter

Diphtheria and Scarlet Fever—In diphtheria the isolation of patients and carriers is recommended as well as the increased application of active immunization In scarlet fever isolation for not less than six weeks in cases free from complications residence in decontamination wards for the same period before going home and the isolation of contacts are important Active immunization with a combined vaccine of scarlatinal streptococci and scarlatinal toxoid has not yet been introduced as a routine practice The prophylactic use of passive immunization by means of serum in diphtheria and scarlet fever should be reserved for special individual cases or for children's departments and wards

SPECIAL JOURNALS

Acta Pathologica et Microbiologica Scandinavica

Copenhagen vol 15 Fasc 1 1938

Peculiar Type of Hemolysis Produced by *Staphylococcus aureus*—T P Kjeldgaard
Studies on Finer Structure of Uterine Blood Vessels of Macacus Monkey—H Okkels and E T Engel
Further Studies on a Transmissible Myeloid Leukosis in White Mice II—H C Ramussen and R Rask Nielsen
Tuberculosis in Axillary Lymph Glands—S Hertz
Studies in Staphylococci VI What Role do Staphylococcus Lysins play in the Rabbit Blood Corpuscles and its Anti-lysin in Staphylococcus Infection in Human Beings?—J Forssman
Morphology of Normal Thyroid Glands I Thyroid in the Newborn—E Koch

Staphylococci—Throughout recent studies of active immunization with staphylococcus toxoid treatment has been controlled and its effect estimated by the titration of anti haemolysin in the patient's blood the red cells used in such tests being rabbits Forssman protests strongly against the validity of this method the only recommendation for which is the fact that the susceptibility of rabbits cells to lysin is more constant than that found in other species He not only finds that the lytic capacity of staphylococcus cultures for rabbit and human red cells does not correspond but claims to have proved that the lysins acting on them are different substances This assertion is based on experiments showing that large amounts of lysin for rabbits cells may be formed in a culture containing only a minimal amount of lysin for human cells and on the results of fixation tests in which the human lysin was absorbed leaving the rabbit lysin The anti lysin for rabbits cells must therefore be considered an antibody unrelated to immunity in the human being and it is not surprising that as numerous clinical observations have shown it can be developed in large amount without corresponding clinical improvement Forssman concludes by saying in making this anti lysin content the basis of an estimation of the therapeutic value of sera intended for human therapy we have in my opinion gone astray and the sooner we get back to the proper path the better

Acta Tuberculosea Scandinavica

Copenhagen vol 10 Fasc 1 1938

Few Cases of Serosis of Larger Bronchi in Pulmonary Tuberculosis—E Sandvej
Mass Investigations into Tuberculosis in Two Norwegian Forest Districts—C Heimbeck
Pleural Effusions and Pleural Adhesions—H Myhre

Mass Investigations in Norway—In one district the author succeeded in examining about 60 per cent of 6 000 inhabitants In each individual a full medical and personal history was obtained and a tuberculin test carried out In those cases showing a positive tuberculin reaction the blood sedimentation rate was determined and the chest screened Films were taken only of those in whom the last examination indicated something abnormal or in those otherwise suspect In the second district the procedure was different The individuals were first screened If any abnormality was detected or the history was unsatisfactory the sedimentation rate was determined a physical examination carried out and when necessary a film taken Of 7 400 inhabitants about 50 per cent submitted to the screening Using the first procedure the author was able to investigate fully about 400 persons a week In the second district he was able to screen about 1 000 people a week Of the 5 760 persons investigated 1.2 per cent were found to suffer from tuberculosis hitherto undetected, requiring active treatment

Pleural Adhesions—In this investigation the radiological pleural appearances were analysed in relation to the possibility

of inducing a pneumothorax In thirty four patients with a previous pleurisy induction was successful in a few cases only In thirty-one patients with an obliterated costo phrenic sinus (whether or not previous pleurisy was known) and in sixteen showing a distinct pleural line a satisfactory pneumothorax was never obtained In eighty patients with one to three single pleural spikes at the apex induction of a pneumothorax was nearly always possible adhesions corresponding to these spikes being generally divisible but adhesions were often present in other situations in addition The results in this group were far better than in a group of 107 patients showing no signs of pleural involvement but with diseased parts of the lung extending to the chest wall In fifty patients with no signs of pleural involvement and no extension of disease to the chest wall a pneumothorax was obtained in every case

American Journal of Cancer

Lancaster Pennsylvania vol 32 April 1938

Comparative Study of Reducing Substance (so-called Glutathione) of Blood in Normal Malignant and Non malignant Conditions —Arnold E Osterberg Robert J Coffey J Arnold Bargen and Claude F Dixon
Studies on Exchange of Potassium between Tumour Cell and Medium —Arthur Lasnitzki
Epidermoid Carcinoma in Osteomyelitis Case Report —J H Harrison
*Sarcoma Development in Mice Injected with Hormones or Hormone like Substances —E L Burns V Suntzeff and Leo Loeb
Transplantable Uterine Rat Sarcoma of 100 per cent Transmissibility —Joseph A Polin
Sarcoma Formation in Autologous Graft of Mammary Tissue —Albert Fischer
Respiratory Quotients of Normal and Leukaemic Mouse Lymphoid Tissue —Joseph Victor and James S Potter
Ability of Tumour Tissue to Oxidize Fatty Acids *in vitro* —Enrico Granati
*Comparative Effect of 200 kV X Rays and Gamma Rays on Pupae of *Drosophila melanogaster* I Determination of Equivalent Roentgen Value for Gamma Rays II Summation Experiments with X Rays and Gamma Rays —J H Muller

Sarcoma following Hormone Injections—Sarcomata were found in ten out of 247 mice injected repeatedly with various hormone preparations eight of the mice had oestrogenic hormones one had lutein and proluton and one liver extract All the tumours save one were at or near the sites of the injections The authors are uncertain whether mechanical injury or a more specific chemical effect was responsible They contrast the sarcoma-producing action with the specific effects of the oestrogenic hormones on the breast and genital tract and with the action of the carcinogenic hydrocarbons and discuss various degrees of specificity in carcinogenic processes

Effect of X Rays and Gamma Rays on Drosophila Pupae — Drosophila pupae were used as test objects in the determination of an equivalent roentgen value for gamma rays No difference was found between the actions of 200 kV x rays and gamma rays on the pupae and the summation of the effects of the two radiations was complete The incomplete summation of effects on the skin erythema threshold is attributed to a qualitative dependence of the skin erythema upon the wave length of the radiation It seems that there are differences in the therapeutic actions of 200 kV x rays supervoltage x rays and gamma radiations which are not satisfactorily accounted for by physical and geometrical factors of dosage distribution

American Journal of Diseases of Children

Chicago vol 55 April 1938

Acute Laryngo tracheobronchitis —J Brennemann W M Clifton A Frank and P Holinger
Tonic Neck Reflexes in Children in Prognosis —R L Byers
*Hysterical Blindness in Children Two Cases —E Wolfe and G S Lachman
Nutritional Heart Disease in Children —J I Waring
Congenital Heart Disease Clinical and Post mortem Study of 105 Cases —S Gibson and W M Clifton
Prophylaxis against Measles with Globulin Fraction of Immune Human Adult Serum —S Karelitz
Hemoglobin Differences in Healthy White and Negro Infants —B Mundey M L Shepherd L Emerson B M Hamil M W Poole I G Macy and T E Rutford

Hysterical Blindness—Two cases are reported and both had many features in common An emotional upset was the starting point in each and was the death of a beloved close relative in one case and the marriage of a brother in the second In each instance there was a loss of affection and attention and both children also had witnessed the special interest given to a friend who had trouble with her eyes Recovery in each case was rapid One was admitted to hospital where the change from home together with encouragement effected a cure in two weeks The second case was cured almost at once in the course of a visit to the physician

Measles Prophylaxis—The globulins were removed from adult serum and prepared in a volume of one sixth to one tenth of the original volume of the serum The use of the serum in preventing measles in those susceptible has been most successful and has the advantage that the amount injected is small The serum can be prepared in any well equipped hospital laboratory and there is less danger of infecting a child with syphilis or tuberculosis There are few reactions and the results are good The serum keeps well without loss of potency

American Journal of Ophthalmology

St Louis Missouri vol 21 April 1938

*Birth Injuries of Cornea —R I Lloyd
Problem of Ocular Tuberculosis —A C Woods
Leber's Disease —J E Rauf and H L Barr
Flicker Perimetry —L L Mayer and I C Sherman
Essential Cardiovascular Hypertension —F T Tooke and J V V Nicholl
Microsurgery in Simple Glaucoma —O Barkan
Trachoma in American Samoa —F Harbert
Cyst of Posterior Chamber —E F Krug
Gonorrhoeal Ophthalmia —J C Geiger and R W Burlingame
Prophylactic for Ophthalmia Neonatorum —V C Rambo
Transparent Exophthalmometer —W H Luedde

Birth Injuries—These injuries are caused by forceps and also by natural delivery, especially where there is some deformity of the pelvic cavity The resulting lesions include glassy rods of Descemet's membrane, glassy membranes in the anterior chamber, and inflammatory strands on the posterior aspect of the cornea Several cases are described in detail Because left occipito anterior presentations are commonest the left eye is most often injured

American Journal of Roentgenology and Radium Therapy

Springfield Illinois vol 39 April 1938

The Laminograph and its Variations —J Kieffer
Body section Roentgenography with Laminograph —S Moore
Ventricular Changes caused by Proved Tumours of Brain —R S Stone and F J Schulze
Roentgen Study of Skull in Epilepsy —H Chor and E E Barth
Historical Review of Roentgen Studies of Gall bladder and Newer Contrast Media of Diagnostic Criteria —L J Friedman and P S Friedman
Aqueous Preparations to Supplant Oil in Roentgenography —H Lilienthal
Benign Bone Lesions showing Spindle-cell Invasion of Bone —J T Murphy
Roentgen Therapy of Infections of Nasal Accessory Sinuses —F M Hodges
*Roentgen Therapy in Angina Pectoris —M G Wasch and S G Schenck
Dosage Chart for Interstitial Radium Element Needles —L A Pomeroy
Healing of Gastric Ulcer with Persistence of Niche —A S Unger and M H Poppel
Boeck's Sarcoid —F J Eichenlaub and I L Sandler
Qualitative Changes in Formed Elements of Blood following Therapeutic Irradiation —K Kornblum V Boerner and S G Henderson
Differences in Relative Action of Neutrons and Roentgen Rays on Closely Related Tissues —R E Zirkle and I Lampe
Secondary Radiation Intensity as a Function of Certain Geometrical Variables —H E Seemann
Spatial Distribution of Radiation from a Supervoltage Roentgen Tube II —K E Corrigan B Cassen and H S Hayden

Tomography—The laminograph tomograph or planigraph a device for the radiographic presentation of sections of the body is described and its principle explained The effects of the various motions on the resulting radiographs and on the exposure time are discussed Circular and spiral motions are advocated for the elimination of troublesome superimposed shadows and a special type of spiral motion well suited for that purpose is described A method for obtaining transverse radiographic sections and a system of planiradioscopy are also discussed The importance of the method in diagnosis and in therapy is stressed

Angina Pectoris—Sixty five patients with angina pectoris not relieved by ordinary medical treatment had x ray treatment applied to the cervico-dorsal and adjacent paravertebral region 68 per cent were improved as shown by reduction in the number severity and duration of the attacks The theory of the action of the x rays is discussed The results are more favourable in angiospastic cases than in those with advanced arteriosclerosis or coronary thrombosis

Sex Differences in Tuberculosis Mortality in United States—C C Dauer
Influence of Sunlight on Experimental Tuberculosis—A C Ukil and S R Guha Thakurtha

Functional Test—This test depends on the fact that in the healthy person the level of oxygen intake returns to a resting level within six minutes of the completion of moderate exercise The excess oxygen used in this period per square metre of the body surface is comparable in different persons The authors describe the use and results of the test in silicosis and in emphysema and in the same conditions complicated by cardiovascular disease

Tuberculous Lymph Nodes—A series of 5000 successive patients attending the tuberculosis dispensary at the Henry Phipps Institute during the years 1923 to 1927 was studied to determine the incidence of tuberculosis of peripheral lymph nodes Results were compared with the records of 1000 successive patients attending the same clinic in the year 1907 The incidence of both active and obsolete tuberculosis was approximately the same in both series The author therefore concludes that a lapse of thirty years has apparently not changed the relationship between glandular and pulmonary tuberculosis

Annales d'Anatomie Pathologique

Paris vol 15 April 1938

Chronic Epithelial Nephritis and Bence Jones Proteinuria—P Vuillemier
Morbid Anatomy of Scarlet Fever associated with Ulcerative Angina in Children with Special Reference to Lesions of Nervous System—V Anghelesco S Fasie and T Pienaru-Cernpanitz
Cranial Internal Meniscus of Knee—L Marchand and H L Guibert
Lymphatics of Pylorus Part of Stomach—C Rohlich
Primary Tuberculosis of Glans Penis (Tuberculous Chancre)—J Brunat
Morphological Studies of Hypercrinia Inflammation in Muscle Atrophic from Inactivity Relation to Participation of Nervous System in Allergic Reactions—J M Lasovsky and D N Wyssokowitsch

Neurology of Allergy—The authors rendered leg muscles in rabbits atrophic by one of two methods—section of the nerve or section of the tendons The animals were then sensitized to horse serum and given an injection of the serum into the atrophic muscle When atrophy had been produced by section of the nerve the usual allergic inflammatory response failed to occur whereas in muscles of which only the tendons had been severed it developed as in normal muscle These observations are said to support the belief that the nervous system takes part in the allergic reaction they are also used in an argument dealing with the nature of muscular atrophy and a supposed misconception of its mode of causation in nerve lesions

Annales de Medecine

Paris vol 43 April 1938

Action of Repeated Insulin Injections on Structure and Function of Langerhans Tissue—E Aubertin A Lacoste and R Sarre
Interdependence of Circulation in Periphery Kidneys and Spleen—M Bürger and D Kohler
Influence of Collateral Circulation in Cases of Cirrhosis on Balance of Glucose Ammonia and Amino-acids in Peripheral Blood after Injection of these Substances—R Martens
Selective Test of Pulmonary Artery Function Estimation of Blood Gases in Lung Diseases—A Oschacki

Repeated Insulin Injections—Repeated insulin injections in five dogs caused an increase in the insulin content of the pancreas and of the dog per kg to a degree higher than that found in a normal dog but lower than that of fasting animals The glucose tolerance curves obtained after injection show that for clinical purposes it is neither possible nor necessary completely and constantly to suppress slight periods of hyperglycæmia at night It is sufficient to regulate the insulin dosage near to a point approximating to that of full regulation

Annals of Tropical Medicine and Parasitology

Liverpool vol 32 April 8 1938

Treatment of Malaria Study of Therapeutics and Prophylaxis of Malaria by Synthetic Drugs as compared with Quinine—League of Nations Health Organisation
Mouth Parts of Female *Simulium damnosum* Theobald with Special Reference to Transformation of *Onchocerca volvulus* Leuckart—E G Gibbins
Notes on Ethiopian Simuliidæ II—E G Gibbins
Latent Stage of Rabies Virus in a Vampire Bat—J L Pawan
Preservation for Records of Blood Films in Tropics—D B Blacklock
Observations on Respiratory Metabolism of Malaria Parasites and Trypanosomes—S Richard Christophers and J D Fulton
Influence Effect of Drugs upon Oxygen Uptake Trypanosomes (*Trypanosoma brucei*) and Malaria Parasites (*Plasmodium knowlesi*)—S Richard Christophers and J D Fulton
Studies in Chemotherapy XVII Action of Undecane Diamidine in Malaria—F Gill Hughes E M Lourie and W Yorke

Respiratory Metabolism of Malaria Parasites and Trypanosomes—Normal or arsenic resistant strains of trypanosomes in the presence of glucose take up large quantities of oxygen Even in the presence of glucose the process becomes gradually inhibited by a reduction in *p*H while deprived of glucose trypanosomes rapidly die Oxygen uptake by malaria parasite substance continues steadily for long periods even in the absence of glucose In a medium containing malaria parasite substance there is considerable consumption of oxygen an approximately equal output of carbon dioxide haemoglobin is altered non protein nitrogen is increased there is no acid formation comparable to that produced by trypanosomes and there is no detectable increase in ammonia the serum appears to play little part in providing the requirements of oxygen uptake and the parasite can readily take oxygen from the oxyhaemoglobin of the cell

Effect of Drugs—Certain drugs cause inhibition of the oxygen uptake in both trypanosomes and malaria parasites The effect is to some degree parallel to therapeutic effect and may be related to it oxygen uptake estimations might constitute a delicate means of studying *in vitro* the lethal action of drugs

Undecane Diamidine—Undecane 1 11 diamidine an experimental trypanocidal substance the formula of which differs entirely from that of any known anti malarial drug was found to have a very definite but temporary action in induced benign tertian and quartan malaria

Archiv für Kinderheilkunde

Stuttgart vol 113 April 14 1938

Adipose nevus Subcutanea Neonatorum—R Zeller
History and Pathogenesis of Adipo-necrosis Subcutanea Neonatorum—O Grutz
Acute Middle ear Disease in Children—J Scheideler
Sugar Content in Cerebrospinal Fluid of Child with Special Reference to Influence of Glycolysis Ferments—B Rimele
New Contributions to Infantile Acrodynia—E Mayerhofer and B Dragisu

Acute Otitis Media—Scheideler's paper underlines three factors (1) the hereditary factor is at least as important as the anatomical in the production of the condition (2) in influenzal otitis it is of importance for prognosis and treatment to distinguish between primary otitis in which the infection

is conveyed by the blood stream and secondary otitis in which infection takes place through the Eustachian tube (3) a rise of temperature is the rule not the exception in otitis media of childhood

Archives of Otolaryngology

Chicago vol 27 April 1938

Facial Palsy of Otitic Origin—A H Persky
Development of Otic Capsule IV Fossula Post Fenestram—T H Bast
Vasomotor Rhinitis and Allied Conditions treated with Sodium Morrhuate Preliminary Report—I E Fishof
*Continuously Open Eustachian Tube—G E Shambaugh
Inflammatory Bronchial Tumours One Case and Review of Literature—B S Pollak S Cohen and A M Gross
Effects of Drugs on Strix Vasculitis—W P Covell
Differential Diagnosis of Bacterial Meningitis of Aural and Nasal Origin—J C Yaskin
Nasal Ionization Histological and Clinical Evaluation—A R Hollender and S D Fabricant
*Direct Implantation of Free Nerve Grafts between Facial Musculature and Facial Trunk First Case reported—L J Cardwell
Closure of Persistent Post-operative Mastoid Fistula by Subcutaneous Pedunculated Flap—I A Copps and G L McCormick
Lateral Pressure Splint for Nose—V H Kazanjian
Tuberculosis of Upper Respiratory Tract Summaries of Literature of Past Two Years—G B Wood

Open Eustachian Tube—The continuously open Eustachian tube although a rare condition is a very definite clinical entity not often described in textbooks It occurs in emaciated patients and is then due to the absorption of a pad of fat normally surrounding the cartilaginous end of the tube (Bezold) Shambaugh has found that other factors may enter into the aetiology of the condition—for example scar contraction in Rosenmuller's fossa after the removal of adenoids or after irradiation of the nasopharynx for carcinoma The treatment consists in the insufflation of a powder composed of 1 part of salicylic acid and 4 parts of boric acid into the Eustachian tube

Free Nerve Grafts—The removal of a parotid tumour necessitated the cutting of the facial nerve trunk and of all the peripheral branches leaving a gap of 6 cm The trunk and branches were marked with black silk Three days later the wound was reopened and free nerve grafts taken from the lateral cutaneous nerve of the thigh and the anterior cutaneous branches of the femoral nerve were transplanted between the freshened edge of the stump of the facial nerve and the peripheral twigs Six months later there was still complete facial paralysis but twelve months after the operation the paralysis had completely recovered except in the forehead area

Archives of Pathology

Chicago vol 25 April 1938

Cardiac Contusion Experimental and Pathological Study—A R Moritz and J P Atkins
Typing of Blood and Seminal Stains by Absorption Test—K E Landé
*Capillary Rupture with Intimal Haemorrhage as Causative Factor in Coronary Thrombosis—J C Paterson
Effect of Certain Arsenates on Liver—W C Von Glahn F B Flinn and W F Keim jun
Effect of 1 2 5 6-Dibenzanthracene on Spindle cell Sarcoma of Rat—F A McJunkin and W Wolnyk
Fate of Erythrocytes and Granulocytes in Spleen following Injection into Blood Stream—H Wehrle
Haemochromatosis with Primary Carcinoma of Liver—C H Binford R L Lawrence and H L Wollenweber
Primary Endothelioma of Spleen—S B Biller
Role of Vitamin B in Resistance—D Perla

Causation of Coronary Thrombosis—The immediate cause thrombosis in atheromatous coronary vessels is unsettled aterson presents evidence that its cause is often the rupture of the intima of capillaries derived from the lumen, owing presumably to softening by atheroma of the supporting stroma and to a high pressure in the capillaries Intimal haemorrhage was demonstrable histologically in thirty two out of thirty-seven thrombosed coronary arteries, and reasons are given for regarding this haemorrhage as the primary event and responsible for the subsequent change in the lumen Intimal haemorrhage was also sometimes found in the absence of thrombosis some other factor must therefore be concerned and it is suggested that this may be stenosis

Australian and New Zealand Journal of Surgery

Sydney vol 7 January 1938

*Hydatid Cysts involving Dome of Liver—L Burnett
Ischæmia—A V Mc Iver
Experimental Observations on Increased Intracranial Pressure—R D Wright
Surgical Treatment of Detachment of Retina—W H Robertson
Hernia and its Operative Treatment—B Quick

Hydatid Cysts—A review of the complications associated with old standing hydatid infection of the liver The methods of surgical treatment are contrasted

British Journal of Anæsthesia

Manchester vol 15 April 1938

Death on the Table Address to Students—G Edwards
Nembutal-chloral Narcosis in Childbirth—F B Mallinson
*Three Disturbing Cases of Spinal Anæsthesia administered according to Etherington Wilson Technique—C W H van der Post
Carbonized Ether for Anæsthesia—K E Madan

Etherington Wilson Technique—The use of percaine, 1 in 1 500 by the Etherington Wilson method was followed in three cases by serious collapse two of the patients died Two operations were Caesarean sections with one death the third was for ectopic gestation The author questions the safety of the method and the accuracy of the figures for the specific gravity of the cerebrospinal fluid and for the diffusion rates of injected fluids on which it is based

British Journal of Ophthalmology

London vol 12 April 1938

*Value of Orthoptic Training—Frank W Law
*Sodium and Mercury Vapour Lamps in Ophthalmology—A J Ballantyne
Histology of Bowman's Membrane in Glaucoma—Graeme Talbot
Exfoliation of Lens Capsule in Glaucoma—Alexander Garrow

Orthoptic Training—The assessment of the value of this treatment depends upon the definition of a cure The author considers that in some cases a good cosmetic result is sufficient some patients only require a moderate degree of fusion and to aim at a good stereopsis is to aim too high Judged on this standard one third of ninety one unselected cases were cured without orthoptic training Further orthoptic training succeeded in curing less than half the cases The greatest disappointment occurred in cases of abnormal retinal correspondence where only three out of fourteen cases were cured by orthoptic training It is suggested that more squints than is generally supposed can be cured by glasses with or without occlusion Only cases in which this treatment has failed should be referred for orthoptic training when a further selection bearing in mind the end result desired is necessary The results of orthoptic training have previously been described too optimistically in the medical press

Sodium and Mercury Vapour Lamps—Lamps suitable for use with a reflecting ophthalmoscope are now available and show up the finest details in the retinal vascular system The mercury vapour light emphasizes the surface reflexes of the retina while these are eliminated by the sodium light which gives a clearer view of changes in the choroid and the deeper layers of the retina

British Journal of Radiology

London vol 11 April 1938

Urography in Pregnancy—E Rohan Williams
Lipiodol in Localization of Spinal Tumours—H M Worth
*Further Observation on Familial Multilocular Cystic Disease of the Jaws—W A Jones
Observations on Cases of Suprarenal Tumour—M H Jupe
Dosage System for Interstitial Radium Therapy I—R Paterson and H M Parker

Effect of X Rays on Trypanosome —Prof L Halberstaedter
Model of Radium Unit for Measuring Dosage and Planning Treatments —L C Grimmett

Familial Multilocular Cystic Disease of the Jaws—The condition described is one of multiple dentigerous cysts occurring throughout both the upper and lower jaws and accompanied by a chronic hyperplasia of the submaxillary lymph glands It usually becomes apparent towards the end of the second year of life The paper is illustrated by radiographs and photographs of several members of one family

British Journal of Surgery

Bristol vol 25 April 1938

Evolution and Development of Surgical Instruments —C J S Thompson
Paralysis of Bladder and Neurological Sequelae of Spinal Anaesthesia —J R Fergusson and K Watkins
Carcinoma of Small Intestine —W J Mac C Wheeler
Exstrophy Associated with Hypertrophy and Cleft Palate —M C Ogden
Chronic Lymphoedema —E D Telford and H T Stimson
Dislocations and Fractured Dislocations of Pelvis —R W Jones
Pathology of Struma Nodulosa Thyroidea —A M Boyd
Fifty-three Cases of Vesical Diverticula —R O Ward
Operation and Obturator for Cleft Palate —R R Fitzgerald
Clinical Course and Pathology of Burns and Scalds under Modern Treatment —W C Wilson A R Mansfield and C P Stewart
Osteochondroma of Ear —E H A Parkinson and S L Baker

Experimental Investigation of Cause of Pain following Spinal Anaesthesia —A D Macdonald and H K Watkins
Nervous Control of Gastric Secretion —T S Hewer
Nervous Factor in Traumatic Shock —D Slesinger and L O'S Austin

Post-spinal Vesical Paralysis—This is an analysis of fourteen cases of this complication The authors are forced to the conclusion that the toxicity of the spinal anaesthetic used—heavy duracaine—is the causative factor Hence they regard this substance as a dangerous anaesthetic

Burns—This article represents a detailed report of the investigation of sixty-five cases Special reference is made to the pathological findings the cause of toxaemia and the optimum method of treatment

British Journal of Venereal Diseases

London vol 14 April 1938

Experimental Contribution to Study of Antisyphilitic Hyperthermia produced by Physical Agencies —J F A Albert-Beckmann
Urethroscopy Study of 600 Cases Patients in a Venereal Disease Hospital —C H Reinhardt W M Brunet and N D Shaw
Cupid and Psyche in English Literature —D Arms Power
Nature and Cause of Phobia with Special Reference to Syphilophobia —J A Hadfield
Syphilitic Epididymitis —A E W McLachlan

Urethroscopy—Reinhardt Brunet and Shaw state that the chief indications for urethroscopy are chronic discharge discomfort in anterior or posterior urethra haemospermia persistent prostatitis premature ejaculation and urethral stricture Essential requirements are careful selection of patients effective anaesthesia gentle instrumentation avoidance of trauma and correct interpretation of what is seen The principal lesions seen in the anterior urethra are soft and hard infiltrations and in the posterior urethra cysts enlarged prostatic ducts congested and enlarged verumontanum and soft and hard infiltrations The technique is described in detail and an account is given of the appearances of the normal urethra and of the most common pathological changes seen It is concluded that the use of the urethroscope is as necessary to physicians who diagnose and treat urological conditions as is the stethoscope to the cardiologist

Syphilitic Epididymitis—McLachlan describes seven cases of syphilitic epididymitis—a comparatively rare lesion three occurred in the secondary and four in the tertiary period In the majority of cases the globus major was involved but the body and globus minor may also be affected The lesions vary in size from that of a pea to that of a large olive and may show tense elasticity or cartilaginous hardness sinus formation may occur Histologically the changes are mainly interstitial and fecundity is not usually affected Diagnosis depends on the exclusion of gonorrhoea tuberculosis cysts and malignant disease concomitant evidence of syphilis—serological or clinical—and possibly demonstration of *Sp pallida* in the epididymal lesion and complete resolution under antispecific treatment Local treatment is symptomatic and consists in support tapping of any hydrocele etc as indicated

Deutsches Archiv für klinische Medizin

Volumetric Estimation of Oxygen in Urine in Renal Disturbances —P Ernst and F V Sachs

Pneumonomycosis Mucorina—A patient developed a prolonged typical rise of temperature after bronchopneumonia fungi were found in the sputum This complication was considered to be possibly due to diabetes Treatment with iodides proved successful as in the only other case previously reported in the literature

Folia Haematologica

Berlin vol 59 1938 Heft 2

Genesis of Red Blood Cells and Platelets in Mammals —J Orkin
Fetal Sternal Punctures in Pulmonary Tuberculosis —F Laberdrix
Hydrogen Ion Concentration Protein in Blood Serum in Myeloma —B v Bonsdorff H Groth and Th Packalen
Occurrence of Erythrocytes Carabae Impregnation with Silver in Experimental Lead Poisoning of Rabbit —M Kawahata and M Nakahara
Influence of Atmospheric Oxygen on Pressure of Carbon with Special Reference to Blood Formation in Embryonic Life —C S Engel
New Treatment of Pernicious Anaemia —J Schereschewsky
Erythropoiesis in Azotaemic Anaemia —S Lewenger
Bibliography of German Haematological Literature (1937) —J Hirschfeld
Bibliography of American Haematological Literature (1937) —O F Hynes

Genesis of Red Cells and Platelets—By the use of a special method of staining and fixation it was shown that the platelets are not derived from the megalokaryocytes It is more likely that they are the nuclei of nucleated red blood cells eliminated at the moment when these cells are leaving the bone marrow By a combination of phenylhydrazine and lead poisoning in mice and rabbits giant platelets are formed which show all the transition stages down to free dislocated nuclei

Blood Serum in Myeloma—Two types of crystals were observed in the serum from cases of myeloma One was found at refrigerator temperature after a few days and was a spontaneous precipitation of boat-shaped rhombic semimorphous protein crystals 2 to 3 mm in length with the richest crystallization in the bottom layer The others occurred at room temperature after ten to fourteen days and were smaller and needle-shaped They were soluble in dilute acids and alkalis at *p*H of from 4·5 to 9 insoluble in water saline alcohol and ether and had a molecular weight of about 200 000 compared with 140 000 to 160 000 for ordinary serum globulins or 40 000 to 70 000 for Bence Jones proteose

Erythropoiesis in Azotaemic Anaemia—The sternal bone marrow usually shows a diminished erythropoiesis and more rarely an increase In azotaemic cases the anaemia is of the toxic form without regeneration The toxic substance either diminishes the erythropoiesis or prevents ripening of the erythroblastic cells

Journal de Chirurgie et Annales de la Societe Belge de Chirurgie

Brussels vol 35 April 1938

Complications of Transfusion—M Seur
*Effects of Surgical Operations on the Heart—A Hustin
Rhizoma of *Spine treated by Unilateral Parathyroidectomy*—L Tixier
Adenoma of Liver—R Goffin

Surgery and the Heart—An account is given of the effects of general and spinal anaesthesia on the pulse rate and also of the effects due to the operation itself The various types of anaesthetic are discussed and graphs illustrating the pulse rate in each case are given The effect of the different surgical procedures on the heart action is also shown by means of diagrams

Journal of Industrial Hygiene and Toxicology

Baltimore vol 20 April 1938

*Formation of Oxalic Acid from Ethylene Glycol and Related Solvents—F H Wiley W C Hueper D S Bergen and F R Blood
*Air Purification in Inhabited Rooms by Spraying or Atomizing Hypochlorites—A T Masterman
Gases from Carbon Arcs—R W Coltman
Biological Effects of Inhalation of Carbon Arc Fumes—E L MacQuiddy J Perry Tollman Leroy W La Towsky and Milward Bayliss
Combustion Products of Carbon Arcs—E L MacQuiddy J Perry Tollman Leroy W La Towsky and Milward Bayliss
Ventilation of Motion Picture Booths—Philip Drinker and J Raymond Snell

Formation of Oxalic Acid—Ethylene glycol and its derivatives are being increasingly used in medicine as solvents Animal experiment showed that their administration produced oxaluria casts calculi and degenerative changes in the kidney

Air Purification by Hypochlorites—This method offers a cheap and effective means of purifying air in inhabited rooms A design for an efficient spray is shown and the technique explained

Journal of Laryngology and Otology

London vol 53 April 1938

*Lympho epithelioma—J I Munro Black
Operative Treatment of Chronic Mastoid Disease—Somerville Hastings
Streptococcal Mastoiditis and Meningitis following Simple Tonsillectomy with Recovery—A B Smith and C E Scott
Repair for Partial Loss of Auricle—C Hamblen Thomas

Lympho epithelioma—Lympho epithelioma are tumours which arise as a rule in the tonsillar region or nasopharynx Clinically these tumours are characterized by an extreme degree of radio-sensitivity, but pathologically there is a good deal of confusion in their classification formerly they were described as sarcomata Surgical extirpation should never be attempted and the treatment of choice is by x ray therapy which usually produces a very rapid local regression If a good immediate result is obtained local recurrence is unlikely If the patient passes the three-year limit without developing distant metastases he may be considered cured Treatment of skeletal deposits is probably useless Of six patients treated by the author, two are alive after five years and one after two years Each of the remaining three survived only a little over one year after treatment

Journal de Radiologie et d'Electrologie

Paris vol 22 April 1938

Bicentenary of Luigi Galvani—E Cottenot
Life and Work of Galvani—F Lugnel Lavastine
Animal Electricity and Modern Bio-electricity—J Belot and H Fischgold
Festivities to Commemorate Galvani Bicentenary (Bologna October 17–20 1937)—J Belot
Experimental Sarcoma following X Ray Irradiation—G Gambarow
Peptic Ulcer of Oesophagus—J Terracol P Lamarque and P Bétoulières
*New Radio-diagnostic Method Pneumo-pre peritoneum—G Boriani
Nicolas Tesla—M Kahn

Pneumo pre-peritoneum—The method described by Boriani consists of injecting the air not into the peritoneal cavity but between the fascia transversalis and the parietal peritoneum The injection is made under radiological control The advantages of this method of pneumo peritoneum are discussed

Journal of Tropical Medicine and Hygiene

London vol 41 April 16 1938

*Third Note on Infectivity to Man of a Strain of *Trypanosoma rhodesiense* Two Further Passages through Antelopes and Tests on Volunteers—J F Corson
Multiple Myeloma with Hyperglobulinaemia—G M Dechered and Lant Holland

Experimental T rhodesiense Infections—A strain of *T rhodesiense* transmitted by *G morsitans* from man to a sheep in October, 1934 and maintained for two years in sheep by cyclical transmission by *G morsitans* was passed successively through two reedbuck an impala a dikdik and then by parallel transmission to an eland and a reedbuck Two African volunteers resisted infection from flies which fed on the eland but were afterwards infected by flies from the reedbuck and a European volunteer resisted infection from a fly infected by the reedbuck Owing to the early death of the flies it was impossible to test the third volunteer with the flies that had infected the first two so that a difference between two flies which had fed on the same animal could not be shown

Klinische Monatsblatter fur Augenheilkunde

Stuttgart vol 100 April 1938

Further Ocular Studies in Uniovular Twins in Advanced Life Inheritance of Senescent Changes—A Vogt
*Ocular Blood Pressure with Special Reference to Pathology of Tabetic Optic Atrophy—K Albrich and F Kukan
Oligodendroglioma Contribution to Intradural Optic Nerve Tumours—E Schreck
Glioblasts and Spongioblasts in Origin of Retinal Tumours—F Fasiolo
*Corneal Lesions in Hereditary Palmar and Plantar Keratosis—H Richner
Crystalline Degeneration of Conjunctiva and Cornea—F Blobner

Ocular Blood Pressure in Tabetic Optic Atrophy—In a critical analysis of the recent work on the relationship of the blood pressures in the retinal vessels to tabetic optic atrophy the authors conclude that on Sobanski's own findings the assumption of any such relationship is unwarranted Such therapeutic results as Sobanski obtained must be ascribed to reasons other than those he advances

Corneal Lesions in Hereditary Keratosis—To the growing literature on the association of eye and skin diseases Richner adds a report of the occurrence of epithelial changes in the cornea in a patient with hereditary keratosis of the palmar and plantar areas Four other cases of eye changes in this affection recorded in the literature are noted

Tubercle

London vol 19 April 1938

*Silicosis in British Coalfields—W E Cooke
Erythrocyte Sedimentation Rate in *Pulmonary* Tuberculosis—A Post
Desensitization of Tuberculous Guinea pigs—J D Thayer

Silicosis—After indicating the incidence of this disease in different parts of the country the author discusses in detail the mineral matter detected in the lungs and the two distinct types of the disease found among coal miners He explains the disparity in the incidence of silicosis in the southern and the northern groups of the British coalfields and suggests measures of prevention

"Vitamin B_1 deficiency an outstanding fault

in the diet of many millions of people

(*B.M.J.* 16 Oct. 1937, p. 75.)

The reduction in Vitamin B_1 intake due to changes in dietary habits during the last hundred years normally amounts to at least 50 per cent. and may be as much as 70 per cent. It has been demonstrated both experimentally and clinically, that a shortage of Vitamin B acts as a limiting factor in the maintenance of health and nutrition and often results in gastro-intestinal disorders, loss of appetite, indigestion, constipation and if long continued to neuritis and arthritis.

The logical way to rectify such shortage is to restore to the diet the Vitamin B containing substance whose removal is responsible for the deficiency.

This substance is available in the form of Bemax.

For years it has been the policy of the proprietors of Bemax to ensure its Vitamin B activity by biological assay of every day's output. So far as is known Bemax is the only food product to which such a claim is or can be made.

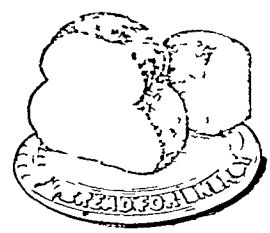
The quantity of Vitamin B_1 supplied by the normal daily dose of Bemax—one tablespoonful—is 200 International Units, an amount sufficient to raise a deficient diet to an optimal level.

The normal daily dose of Bemax supplies in addition to Vitamin B significant quantities of Vitamin B and B Copper Iron and Phosphorus as well as rich quantities of Vitamin E and other essential dietary elements.

Bemax is an entirely natural product consisting only of tabulised wheat germs selected for their Vitamin B_1 activity with no addition whatsoever. Clinical sample and literature on request. The Bemax Laboratories, 23, Upper Mall, Hammersmith, W.6.

Sterility and Habitual Abortion

The increasing use of Vitamin E for habitual abortion and sterility of dietary origin demands a wheat germ oil of proven high activity and of stable Vitamin value. Such an oil is available for the medical profession in Fertilol.



FERTILOL

Wheat Germ Oil Capsules

A highly active source of Vitamin E

A complimentary box of Fertilol Capsules and brochure sent on request

Vitamins Ltd.,
(Dept. B.65) Upper Mall, London, W.6.

Dietary authorities agree that the average diet should be built around bread and milk.

BREAD

. . . for energy
